

Electricity

Moving electricity is called current electricity. To make electricity move and work for us, an electrical circuit is needed. The electrons are attracted to the protons.

If one end of a wire is attached to the negative (electron) post on a battery, and the other end of the wire is attached to the positive (proton) post, the electrons will move to the protons. Now the electricity is moving.

Picture a battery with a long wire attached from one post to the other post. The electricity that is stored in the battery is moving from the negative post to the positive post because the electrons are attracted to the protons.

If we connect a light bulb to the wire between the two posts the electricity will then move from the negative post, through the light bulb, and into the positive post. When the electricity moves through the light bulb, the light turns on. Now the moving electricity is working for us.

If we remove the wire from the negative post or the positive post, of the battery, the electricity will not move. We use switches to turn lights on and off. The on switch allows the electricity to move, the off switch stops the electricity.
