**Tagging and Tracking of Marine Animals with Electronic Devices** Jennifer L. Nielsen,Haritz Arrizabalaga,Nuno Fragoso,Alistair Hobday,Molly Lutcavage,John Sibert,2009-06-10 The 2nd international tagging and tracking symposium was held in San Sebastian Spain in October 2007 seven years after the first symposium was held in Hawaii in 2000 Sibert and Nielsen 2001 In the intervening seven years there have been major advances in both the capability and reliability of electronic tags and analytical approaches for geolocation of tagged animals in marine habitats Advances such as increased data storage capacity sensor development and tag miniaturization have allowed researchers to track a much wider array of marine animals not just large and charismatic species Importantly data returned by these tags are now being used in population analyses and movement simulations that can be directly utilized in stock assessments and other management applications Papers in this volume are divided into three sections the first describing insights into behavior achieved using acoustic archival and novel tags the second reporting on advances in methods of geolocation while the final section includes contributions where tag data have been used in management of marine species Accurate documentation of animal movements and behaviors in critical marine habitats are impossible to obtain with other technologies The management and conservation of marine species are critical in today s changing ocean environment and as electronic tags become more accurate and functional for a diversity of organisms their application continues to grow setting new standards in science and technology **Official Gazette of the United States Patent and Trademark Office** ,2006 Federal Financial Support of Physical Facilities and Major Equipment National Science Foundation (U.S.),1957 **Soviet Union** Theodore E. **Wireless Bioelectronic Devices Driven by Deep Red Light** Marie Jakešová, 2021-01-22 The use of electronic devices in medical care is one of the main targets of precision medicine The field of bioelectronic medicine uses electronic devices to diagnose or treat diseases and disorders in a complementary or alternative way to chemical drugs It has been more than sixty years since the world's first implantable battery driven cardiac pacemaker was implanted here in Sweden Since then electronic therapies have been implemented for neurological disorders such as Parkinson's disease epilepsy sensory and motor function restoration and many more However electronics can also be used for delivery of conventional drugs in a more controlled localized and specific fashion Therapeutic utility and patient comfort are maximized when the devices are as minimally invasive as possible The most important milestone in the development of the cardiac stimulator was making it wireless The early versions of the device required bulky parts to be placed outside of the body with transcutaneous electrical leads to the target site which led to high infection risk and frequent failures To date batteries remain the most common way to power implantable electronics However their large size and the necessity for replacement surgeries makes the technology relatively invasive Alternative approaches to wireless power transfer are thus sought after The most promising technologies are based on electromagnetic ultrasound or light coupling methods The aim of this thesis is to utilize tissue penetrating deep red light for powering implantable devices The overarching concept is an organic photovoltaic based on small molecule donor acceptor bilayer junctions which allows for ultrathin flexible minimally invasive devices Within this thesis the photovoltaic device was utilized in two ways Firstly the photovoltaics are fabricated to act as an integrated driver for other implantable electronic components 1 an organic electronic ion pump for acetylcholine delivery 2 a depth probe microelectrode stimulation device for epilepsy applications Secondly an alternative device the organic electrolytic photocapacitor is formed by replacing one of the solid electrodes by an electrolytic contact thus yielding a minimalistic device acting as a direct photoelectrical stimulator Within the thesis the photocapacitive stimulation mechanism is validated by studying voltage gated ion channels in a frog oocyte model Next two lithography based patterning techniques are developed for fabricating these devices with better resolution and on flexible substrates suitable for in vivo operation Finally a chronic implant is demonstrated for in vivo sciatic nerve stimulation in rodents The end result of this thesis is a series of novel device concepts and methods for stimulation of the nervous system using deep red light
