The Next Generation of Electric Power Unit Commitment Models Benjamin F. Hobbs, Michael H. Rothkopf, Richard P. O'Neill, Hung-po Chao, 2006-04-11 Over the years the electric power industry has been using optimization methods to help them solve the unit commitment problem The result has been savings of tens and perhaps hundreds of millions of dollars in fuel costs Things are changing however Optimization technology is improving and the industry is undergoing radical restructuring Consequently the role of commitment models is changing and the value of the improved solutions that better algorithms might yield is increasing The dual purpose of this book is to explore the technology and needs of the next generation of computer models for aiding unit commitment decisions Because of the unit commitment problem's size and complexity and because of the large economic benefits that could result from its improved solution considerable attention has been devoted to algorithm development in the book More systematic procedures based on a variety of widely researched algorithms have been proposed and tested These techniques have included dynamic programming branch and bound mixed integer programming MIP linear and network programming approaches and Benders decomposition methods among others Recently metaheuristic methods have been tested such as genetic programming and simulated annealing along with expert systems and neural networks Because electric markets are changing rapidly how UC models are solved and what purposes they serve need reconsideration Hence the book brings together people who understand the problem and people who know what improvements in algorithms are really possible The two fold result in The Next Generation of Electric Power Unit Commitment Models is an assessment of industry needs and new formulations and computational approaches that promise to make unit commitment models more responsive to those needs

Computational Complexity of some Optimization

Problems in Planning Meysam Aghighi, 2017-05-17 Automated planning is known to be computationally hard in the general case Propositional planning is PSPACE complete and first order planning is undecidable One method for analyzing the computational complexity of planning is to study restricted subsets of planning instances with the aim of differentiating instances with varying complexity We use this methodology for studying the computational complexity of planning Finding new tractable i.e polynomial time solvable problems has been a particularly important goal for researchers in the area The reason behind this is not only to differentiate between easy and hard planning instances but also to use polynomial time solvable instances in order to construct better heuristic functions and improve planners We identify a new class of tractable cost optimal planning instances by restricting the causal graph We study the computational complexity of oversubscription planning such as the net benefit problem under various restrictions and reveal strong connections with classical planning Inspired by this we present a method for compiling oversubscription planning problems into the ordinary plan existence problem We further study the parameterized complexity of cost optimal and net benefit planning under the same restrictions and show that the choice of numeric domain for the action costs has a great impact on the parameterized complexity We

finally consider the parameterized complexity of certain problems related to partial order planning In some applications less restricted plans than total order plans are needed Therefore a partial order plan is being used instead When dealing with partial order plans one important question is how to achieve optimal partial order plans i e having the highest degree of freedom according to some notion of flexibility We study several optimization problems for partial order plans such as finding a minimum deordering or reordering and finding the minimum parallel execution length
