The Geophysiology of Amazonia Robert E. Dickinson, 1987-02-13 Looks at the most important processes linking climate and vegetation in the tropics in general and in the Amazon in particular Through individual reviews by some of the world's leading scientists it covers such subjects as modeling tropical meteorology and climate tropical microclimatology connections of vegetation to climate and impacts of tropical deforestation on regional and global climate Editorial summaries integrate this material into an overall perspective Features an essay on protecting the global environment by James Lovelock

The Climate Modelling Primer Kendal McGuffie, Ann Henderson-Sellers, 2014-01-31 As a consequence of recent increased awareness of the social and political dimensions of climate many non specialists discover a need for information about the variety of available climate models A Climate Modelling Primer Fourth Edition is designed to explain the basis and mechanisms of all types of current physically based climate models A thoroughly revised and updated edition this book will assist the reader in understanding the complexities and applicabilities of today's wide range of climate models Topics covered include the latest techniques for modelling the coupled biosphere ocean atmosphere system information on current practical aspects of climate modelling and ways to evaluate and exploit the results discussion of Earth System

Models of Intermediate Complexity EMICs and interactive exercises based on Energy Balance Model EBM and the Daisyworld model Source codes and results from a range of model types allows readers to make their own climate simulations and to view the results of the latest high resolution models Now in full colour throughout and with the addition of cartoons to enhance student understanding the new edition of this successful textbook enables the student to tackle the difficult subject of climate modeling

The Development of Atmospheric General Circulation Models Leo Donner, Wayne Schubert, Richard Somerville, 2011 Presents unique perspectives from leading researchers on the development and application of atmospheric general circulation models It is a core reference for academic researchers and professionals involved in atmospheric physics meteorology and climate science and a resource for graduate level courses in climate modeling and numerical weather prediction

The Ecozones of the World Jürgen Schultz, 2013-06-29 The preliminary work on this book goes back to lectures and seminars which I held on the subject of an ecological division of the world at the Geographical Department of the Aachen University of Technology RWTH Aachen The idea of presenting this material in book form arose as I became aware that no modern compendium exists in either German or English or in any other language as far as I know which could have aided me in preparing these courses or would have helped the participating students to review the material presented in the classroom Existing studies on major land ecosystems some of which are highly detailed have been published over the past 15 years by firms such as the Springer Verlag Ecological Studies the Cambridge University Press International Biological Programme and the Elsevier Scientific Publishing Company Ecosystems of the World all suffer from the fact that individual aspects mainly botanical ecological ones are given the utmost consideration while other aspects often pedological and geomorphological ones are almost entirely neglected Furthermore it is most aggravating that the various studies have failed to establish consistent terminology units of measurement and organization of the data for all of the global ecosystems thus making it difficult even for the knowledgeable reader to make comparisons The individual nature of each ecozone therefore remains unclear since it is precisely these differences that allow those characteristics peculiar to a specific ecozone to be unmistakably recognized

Tropical Forest Community Ecology Walter Carson, Stefan Schnitzer, 2011-08-31 Historically tropical ecology has been a science often content with descriptive and demographic approaches which is understandable given the difficulty of studying these ecosystems and the need for basic demographic information Nonetheless over the last several years tropical ecologists have begun to test more sophisticated ecological theory and are now beginning to address a broad array of questions that are of particular importance to tropical systems and ecology in general Why are there so many species in tropical forests and what mechanisms are responsible for the maintenance of that vast species diversity What factors control species coexistence Are there common patterns of species abundance and distribution across broad geographic scales What is the role of trophic interactions in these complex ecosystems How can these fragile ecosystems be conserved Containing contributions from some of the world's leading

tropical ecologists Tropical Forest Community Ecology provides a summary of the key issues in the discipline of tropical ecology Includes contributions from some of the world s leading tropical ecologists Covers patterns of species distribution the maintenance of species diversity the community ecology of tropical animals forest regeneration and conservation of tropical ecosystems Forest Canopies Margaret D. Lowman,H. Bruce Rinker,2004-09-28 The treetops of the world s forests are where discovery and opportunity abound however they have been relatively inaccessible until recently This book represents an authoritative synthesis of data anecdotes case studies observations and recommendations from researchers and educators who have risked life and limb in their advocacy of the High Frontier With innovative rope techniques cranes walkways dirigibles and towers they finally gained access to the rich biodiversity that lives far above the forest floor and the emerging science of canopy ecology In this new edition of Forest Canopies nearly 60 scientists and educators from around the world look at the biodiversity ecology evolution and conservation of forest canopy ecosystems Comprehensive literature list State of the art results and data sets from current field work Foremost scientists in the field of canopy ecology Expanded collaboration of researchers and international projects User friendly format with sidebars and case studies Keywords and outlines for each chapter Global Warming and the Greenhouse Effect, January 1979 - May 1989 Jayne T. Applied Climatology Allen Perry,Dr Russell Thompson,Russell Thompson,2013-03-07 Big freeze conditions storms severe flooding droughts and heatwaves recent extremes in weather with their resultant physical economic and human losses highlight the vulnerability of society to changes in the atmosphere Atmospheric pollution urbanization natural atmospheric disasters are causing dramatic changes in climatic environments Applied Climatology examines the effects of climate on physical biological and cultural environments Specialist contributors from Europe North America and Australasia examine the impacts of changing climates on the functioning and development of physical biological environments including glaciers water resources landforms soils vegetation and animals Weather and climate effects day to day activities and lifestyles from the clothes we wear to the buildings we design and the food and energy we produce This book focusses on the relationship between climate and a wide range of human activities and responses relating to health and comfort building design transport systems agriculture and fisheries tourism and social industrial and legal issues Climate environment relationships and impacts on human activities are predicted to change dramatically if global warming accelerates at the rates currently proposed Applied Climatology examines the characteristics and consequences of the changing global climate and considers the future for both natural and human environments *Forest Ecosystems, Forest Management and the Global Carbon Cycle* Michael J. Apps,David T. Price,2013-06-29 Globally forest vegetation and soils are both major stores of terrestrial organic carbon and major contributors to the annual cycling of carbon between the atmosphere and the biosphere Forests are also a renewable resource vital to the everyday existence of millions of people since they provide food shelter fuel raw materials and many other benefits The combined effects of an expanding global population and increasing consumption of

resources however may be seriously endangering both the extent and future sustainability of the world's forests. About thirty chapters cover four main themes: the role of forests in the global carbon cycle; effects of past, present and future changes in forest land use; the role of forest management products and biomass on carbon cycling and socio-economic impacts.

Forests in a Full World G. M. Woodwell, Ola Ullsten, 2001-01-01 Having surged past the six billion mark, the human population of the twenty-first century is making overwhelming demands on the earth and its forests. Although economic and political considerations once dominated the management of forests and land in today's crowded world, environmental concerns are rapidly emerging as dominant. This book, drawn from experience with the World Commission on Forests and Sustainable Development, presents a concise, accessible view of the current status of forests globally, of demands on them and of their importance in maintaining a fully functional human habitat. The book also presents a major challenge in planning for land use in a full world where defense of the public interest becomes more and more difficult and demanding. Opening with an examination of forests and the effects of human activities on them, the book then considers the relationship of forests to global warming, agriculture, biotic impoverishment, water resources and climate. Later chapters discuss the global wood supply, plantation forestry and forests as a source of energy. The final chapters call for local and global planners to weigh the spiraling competitive demands for forest resources and to redefine what is in the public interest in the context of forests.

The Fate of the Forest Susanna B. Hecht, Alexander Cockburn, 2011-01-15 The Amazon rain forest covers more than five million square kilometers amid the territories of nine different nations. It represents over half of the planet's remaining rain forest. Is it truly in peril? What steps are necessary to save it? To understand the future of Amazonia, one must know how its history was forged: in the eras of large pre-Columbian populations; in the gold rush of conquistadors; in centuries of slavery; in the schemes of Brazil's military dictators in the 1960s and 1970s; and in new globalized economies where Brazilian soy and beef now dominate while the market in carbon credits raises the value of standing forest. Susanna Hecht and Alexander Cockburn show in compelling detail the panorama of destruction as it unfolded and also reveal the extraordinary turnaround that is now taking place thanks to both the social movements and the emergence of new environmental markets. Exploring the role of human hands in destroying and saving this vast forested region, *The Fate of the Forest* pivots on the murder of Chico Mendes, the legendary labor and environmental organizer assassinated after successful confrontations with big ranchers. A multifaceted portrait of Eden under siege, complete with a new preface and afterword by the authors, this book demonstrates that those who would hold a mirror up to nature must first learn the lessons offered by some of their own people.

The Forest Frontier Peter A. Furley, 2024-06-25 Originally published in 1994, this book analysed land developments, deforestation and pasture substitution, colonisation schemes and spontaneous settlement during the latter part of the 20th Century. In so doing, *The Forest Frontier* presents an overview of the intrinsic environmental and socio-economic resources of the Roraima, the most northerly of the Brazilian Amazon states. Roraima is of special environmental interest.

because of its extensive savannas and varied forests the home of some of the largest and most diverse groups of indigenous Indians This critical assessment of the nature and pace of agricultural advance into Roraima examines the range of strategies which have been proposed to cope with the inevitable development With the conflict between preserving the natural environment and development still major issues for Brazil this book remains as relevant now as when it was first published
