measurements Cost effective high quality testing of geo materials is possible if you understand the important factors and work with nature wisely Geotechnical Laboratory Measurements for Engineers guides geotechnical engineers and students in conducting efficient testing without sacrificing the quality of results Useful as both a lab manual for students and as a reference for the practicing geotechnical engineer the book covers thirty of the most common soil tests referencing the ASTM standard procedures while helping readers understand what the test is analyzing and how to interpret the results Features include Explanations of both the underlying theory of the tests and the standard testing procedures The most commonly taught laboratory testing methods plus additional advanced tests Unique discussions of electronic transducers and computer controlled tests not commonly covered in similar texts A support website at www.wiley.com/college/germaine with blank data sheets you can use in recording the results of your tests as well as Microsoft Excel spreadsheets containing raw data sets supporting the experiments **Journal of Geotechnical Engineering**, 1995 **Geotechnical Properties, Behavior, and Performance of Calcareous Soil**, 1982

Dynamic Image Analysis of Granular Materials Magued Iskander, Linzhu Li, 2024-05-18 This book explores the effectiveness of Dynamic Image Analysis DIA in granulometry studies of sand and presents criteria for soil characterization using DIA including test parameters specimen size efficacy in gap graded soils and its limitations DIA is a modern experimental technique used to analyze and classify particulate materials

based on their size shape and other morphological properties This method employs a high frame rate camera to capture images of individual sand particles which have been transported and separated using various techniques DIA generates both particle size and shape information by analyzing thousands to millions of particles providing a quantitative statistical description of grain size and shape distribution within the specimen The manuscript also offers a comprehensive examination of 2D and 3D particle size and shape descriptors It demonstrates that there is no correlation between size and shape parameters in many sands and that shape descriptors can be reduced to four independent parameters representing sand granulometry at different scales Additionally the use of DIA in exploring the depositional history of two complex calcareous sands is presented The manuscript presents the properties of 30 representative sands including size and shape parameters and fits them to statistical distributions The investigated soils encompass both natural and machine sorted materials particles with regular and irregular shapes as well as siliceous and calcareous sands Physical granulometry of sand particles is compared using 2D 3D DIA and micro computed tomography CT The work demonstrates that DIA offers significant advantages in terms of efficiency for 3D shape analysis while providing an adequate representation of particle sizes and shapes of most sands Finally the manuscript integrates classical geotechnical engineering with computer vision and artificial intelligence Size and shape descriptors are utilized for sand classification through machine learning models This work represents a crucial step toward the automatic machine classification of soils potentially enabling on site classification using smartphones equipped with high resolution cameras
