Flash Memories:

Flash Memories Paulo Cappelletti, Carla Golla, Piero Olivo, Enrico Zanoni, 2013-11-27 A Flash memory is a Non Volatile Memory NVM whose unit cells are fabricated in CMOS technology and programmed and erased electrically In 1971 Frohman Bentchkowsky developed a floating polysilicon gate transistor in which hot electrons were injected in the floating gate and removed by either Ultra Violet UV internal photoemission or by Fowler Nordheim tunneling This is the unit cell of EPROM Electrically Programmable Read Only Memory which consisting of a single transistor can be very densely integrated EPROM memories are electrically programmed and erased by UV exposure for 20 30 mins In the late 1970s there have been many efforts to develop an electrically erasable EPROM which resulted in EEPROMs Electrically Erasable Programmable ROMs EEPROMs use hot electron tunneling for program and Fowler Nordheim tunneling for erase The EEPROM cell consists of two transistors and a tunnel oxide thus it is two or three times the size of an EPROM Successively the combination of hot carrier programming and tunnel erase was rediscovered to achieve a single transistor EEPROM called Flash EEPROM The first cell based on this concept has been presented in 1979 3 the first commercial product a 256K memory chip has been presented by Toshiba in 1984 4 The market did not take off until this technology was proven to be reliable and manufacturable 5

characteristics are translated into quantitative performance indicators Performance indicators are applied to identify and quantify product and technology innovation within adjacent areas to fulfill the application requirements with an overall cost optimized solution Cost density performance and durability values are combined into a common factor performance indicator which fulfills the application requirements

Inside NAND Flash Memories Rino Micheloni, Luca Crippa, Alessia Marelli, 2010-07-27 Digital photography MP3 digital video etc make extensive use of NAND based Flash cards as storage media To realize how much NAND Flash memories pervade every aspect of our life just imagine how our recent habits would change if the NAND memories suddenly disappeared To take a picture it would be necessary to find a film as well as a traditional camera disks or even magnetic tapes would be used to record a video or to listen a song and a cellular phone would return to be a simple mean of communication rather than a multimedia console The development of NAND Flash memories will not be set down on the mere evolution of personal entertainment systems since a new killer application can trigger a further success the replacement of Hard Disk Drives HDDs with Solid State Drives SSDs SSD is made up by a microcontroller and several NANDs As NAND is the technology driver for IC circuits Flash designers and technologists have to deal with a lot of challenges Therefore SSD system developers must understand Flash technology in order to exploit its benefits and countermeasure its weaknesses

Inside NAND Flash Memories is a comprehensive guide of the NAND world from circuits design analog and digital to Flash reliability including radiation effects from testing issues to high performance DDR interface from error correction codes to NAND applications like Flash cards and SSDs

3D Flash Memories Rino Micheloni, 2016-05-26 This book walks the reader through the next step in the evolution of NAND flash memory technology namely the development of 3D flash memories in which multiple layers of memory cells are grown within the same piece of silicon It describes their working principles device architectures fabrication techniques and practical implementations and highlights why 3D flash is a brand new technology After reviewing market trends for both NAND and solid state drives SSDs the book digs into the details of the flash memory cell itself covering both floating gate and emerging charge trap technologies There is a plethora of different materials and vertical integration schemes out there New memory cells new materials new architectures 3D Stacked BiCS and P BiCS 3D FG 3D VG 3D advanced architectures basically each NAND manufacturer has its own solution Chapter 3 to chapter 7 offer a broad overview of how 3D can materialize The 3D wave is impacting emerging memories as well and chapter 8 covers 3D RRAM resistive RAM crosspoint arrays Visualizing 3D structures can be a challenge for the human brain this is way all these chapters contain a lot of bird s eye views and cross sections along the 3 axes The second part of the book is devoted to other important aspects such as advanced packaging technology i e TSV in chapter 9 and error correction codes which have been leveraged to improve flash reliability for decades Chapter 10 describes the evolution from legacy BCH to the most recent LDPC codes while chapter 11 deals with some of the most recent advancements in the ECC field Last but not least chapter 12 looks at 3D flash memories from a system

perspective Is 14nm the last step for planar cells Can 100 layers be integrated within the same piece of silicon Is 4 bit cell possible with 3D Will 3D be reliable enough for enterprise and datacenter applications These are some of the questions that this book helps answering by providing insights into 3D flash memory design process technology and applications

Channel and Source Coding for Non-Volatile Flash Memories Mohammed Rajab,2020-01-02 Mohammed Rajab proposes different technologies like the error correction coding ECC sources coding and offset calibration that aim to improve the reliability of the NAND flash memory with low implementation costs for industrial application The author examines different ECC schemes based on concatenated codes like generalized concatenated codes GCC which are applicable for NAND flash memories by using the hard and soft input decoding Furthermore different data compression schemes are examined in order to reduce the write amplification effect and also to improve the error correct capability of the ECC by combining both schemes

Scaled Planar Floating-gate NAND Flash Memory Technology Shyam Sunder

Raghunathan, 2010 NAND flash memories are ubiquitous in their use as portable storage media in cellphones cameras music players and other portable electronic devices The NAND flash memory device consisting of a floating gate transistor cell is the most aggressively scaled electronic device as evidenced by ever increasing memory capacities In this work we will examine possible problems arising from continued scaling of these structures and discuss novel solutions to overcome them Firstly we investigate scaling of the conventional poly silicon floating gate aimed at reducing cell to cell interference We experimentally delineate a new reliability concern for the first time with programming current through ultra thin poly silicon floating gates becoming increasingly ballistic We also experimentally demonstrate doping related issues in the poly silicon floating gate We then apply a novel metal based floating gate cell for the first time designed to overcome the problems discussed above We explore factors that influence the choice of metal and demonstrate excellent functionality in ultra thin metal floating gate cells scaled down to 3 nm TiN floating gate thickness thus greatly reducing cell to cell interference Finally in order to facilitate continued scaling of the control dielectric we explore replacement of the conventional silicon oxide nitride dielectric with high k dielectric materials We integrate poly silicon and metal floating gate cells with Al₂O₃ high k control dielectric Further we establish that a deeper work function control gate is helpful in reducing gate injection Combining ultra thin metal floating gate high k control dielectric and deep work function control gate we enable the planar floating gate cell as a scalable candidate
