Combinatorial Aspects of Lie Superalgebras Alexander A. Mikhalev, Andrej A. Zolotykh, 1995-06-09 Combinatorial Aspects of Lie Superalgebras emphasizes the algorithmic and computational aspects of the combinatorial techniques of Lie superalgebras. It is written primarily for mathematicians and scientists who do not have a background in the field of infinite dimensional Lie superalgebras but who realize the potential uses of the results. Consequently the discussions provided on the applications of Lie superalgebras theory are clear and comprehensive and throughout the text primary attention is given to algorithms and examples. The examples illustrate theoretical results and the algorithms which can be used for symbolic calculations with Lie superalgebras are based on basic and generally applicable rules and theorems. Combinatorial Aspects of Lie Superalgebras contains comprehensive literature citations and provides an excellent reference on the techniques and results of combinatorial theory of Lie superalgebras. Programs that have been developed by the authors for computation are included on a diskette at the back of the book and complete directions for use are provided.

Extending Structures Ana Agore, Gigel Militaru, 2019-08-29 Extending Structures Fundamentals and Applications treats the extending structures ES problem in the context of groups Lie Leibniz algebras associative algebras and Poisson Jacobi algebras This concisely written monograph offers the reader an incursion into the extending structures problem which provides a common ground for studying both the extension problem and the factorization problem Features Provides a unified approach to the extension problem and the factorization problem Introduces the classifying complements problem as a sort of converse of the factorization problem and in the case of groups it leads to a theoretical formula for computing the number of types of isomorphisms of all groups of finite order that arise from a minimal set of data Describes a way of classifying a certain class of finite Lie Leibniz Poisson Jacobi associative algebras etc using flag structures Introduces new non abelian cohomological objects for all of the aforementioned categories As an application to the approach used for dealing with the classification part of the ES problem the Galois groups associated with extensions of Lie algebras and associative algebras are described

Handbook of Algebra M. Hazewinkel, 2006-05-30 Algebra as we know it today consists of many different ideas concepts and results A reasonable estimate of the number of these different items would be somewhere between 50 000 and 200 000 Many of these have been named and many more could and perhaps should have a name or a convenient designation Even the nonspecialist is likely to encounter most of these either somewhere in the literature disguised as a definition or a theorem or to hear about them and feel the need for more information If this happens one should be able to find enough information in this Handbook to judge if it is worthwhile to pursue the quest In addition to the primary information given in the Handbook there are references to relevant articles books or lecture notes to help the reader An excellent index has been included which is extensive and not limited to definitions theorems etc The Handbook of Algebra will publish articles as they are received and thus the reader will find in this third volume articles from twelve different sections The advantages of this scheme are two fold accepted articles will be published quickly and the outline of the Handbook can be allowed to evolve as the various volumes are published A particularly important function of the Handbook is to provide professional mathematicians working in an area other than their own with sufficient information on the topic in question if and when it is needed Thorough and practical source for information Provides in depth coverage of new topics in algebra Includes references to relevant articles books and lecture notes

Séminaire d'Algèbre Paul Dubreil et Marie-Paule Malliavin Marie-Paule Malliavin, 2006-11-14 Rings with Generalized Identities Konstant I. Beidar, Wallace S. Martindale, Alexander V. Mikhalev, 1995-11-17 Discusses the latest results concerning the area of noncommutative ring theory known as the theory of generalized identities GIs detailing Kharchenko's results on GIs in prime rings Chuang's extension to antiautomorphisms and the use of the Beidar Mikhalev theory of orthogonal

completion in the semiprime case Provides novel proofs of existing results

Formal Power Series and Algebraic Combinatorics Daniel Krob,Alexander A. Mikhalev,Alexander V. Mikhalev,2013-03-09 This book contains the extended abstracts presented at the 12th International Conference on Power Series and Algebraic Combinatorics FPSAC 00 that took place at Moscow State University June 26 30 2000 These proceedings cover the most recent trends in algebraic and bijective combinatorics including classical combinatorics combinatorial computer algebra combinatorial identities combinatorics of classical groups Lie algebra and quantum groups enumeration symmetric functions young tableaux etc Multiplicative Invariant Theory Martin Lorenz,2005-03-10 Multiplicative invariant theory as a research area in its own right within the wider spectrum of invariant theory is of relatively recent vintage The present text offers a coherent account of the basic results achieved thus far Multiplicative invariant theory is intimately tied to integral representations of finite groups Therefore the field has a predominantly discrete algebraic flavor Geometry specifically the theory of algebraic groups enters through Weyl groups and their root lattices as well as via character lattices of algebraic tori Throughout the text numerous explicit examples of multiplicative invariant algebras and fields are presented including the complete list of all multiplicative invariant algebras for lattices of rank 2 The book is intended for graduate and postgraduate students as well as researchers in integral representation theory commutative algebra and mostly invariant theory

Deformation Theory and Quantum Groups with Applications to Mathematical Physics Murray Gerstenhaber, 1992 Quantum groups are not groups at all but special kinds of Hopf algebras of which the most important are closely related to Lie groups and play a central role in the statistical and wave mechanics of Baxter and Yang Those occurring physically can be studied as essentially algebraic and closely related to the deformation theory of algebras commutative Lie Hopf and so on One of the oldest forms of algebraic quantization amounts to the study of deformations of a commutative algebra A of classical observables to a noncommutative algebra A_h of operators with the infinitesimal deformation given by a Poisson bracket on the original algebra A This volume grew out of an AMS IMS SIAM Joint Summer Research Conference held in June 1990 at the University of Massachusetts at Amherst The conference brought together leading researchers in the several areas mentioned and in areas such as q special functions which have their origins in the last century but whose relevance to modern physics has only recently been understood Among the advances taking place during the conference was Majid's reconstruction theorem for Drinfeld's quasi Hopf algebras Readers will appreciate this snapshot of some of the latest developments in the mathematics of quantum groups and deformation theory

Local Multipliers of C^* -Algebras Pere Ara, Martin Mathieu, 2012-12-06 Many problems in operator theory lead to the consideration of operator equations either directly or via some reformulation More often than not however the underlying space is too small to contain solutions of

these equations and thus it has to be enlarged in some way. The Berberian Quigley enlargement of a Banach space which allows one to convert approximate into genuine eigenvectors serves as a classical example. In the theory of operator algebras a C^* -algebra A that turns out to be small in this sense traditionally is enlarged to its universal enveloping von Neumann algebra \tilde{A} . This works well since von Neumann algebras are in many respects richer and from the Banach space point of view \tilde{A} is nothing other than the second dual space of A . Among the numerous fruitful applications of this principle is the well known Kadison-Sakai theorem ensuring that every derivation δ on a C^* -algebra A becomes inner in \tilde{A} though δ may not be inner in A . The transition from A to \tilde{A} however is not an algebraic one and cannot be since it is well known that the property of being a von Neumann algebra cannot be described purely algebraically. Hence if the C^* -algebra A is small in an algebraic sense say simple it may be inappropriate to move on to \tilde{A} . In such a situation A is typically enlarged by its multiplier algebra $M(A)$.
