

BLUE CARBON

COASTAL AND MARINE ECOSYSTEMS SUCH AS MANGROVE FORESTS, SEAGRASS BEDS AND TIDAL MARSHES CAPTURE AND STORE A HUGE AMOUNT OF CARBON. THIS IS CALLED BLUE CARBON

70% OF OCEAN CARBON

Coastal ecosystems occupy less than 0.5% of the global ocean surface area, yet store around 70% of total carbon sequestered by the world's oceans.

MORE THAN FORESTS

Mangroves, seagrass and tidal marshes store more carbon per unit area than terrestrial forests and play a crucial role in mitigating climate change.

SEAGRASSES

grow very fast, absorbing carbon from sea water to build their leaves and roots. Seagrass beds secure sediment and dead organic matter, storing a significant amount of carbon in the soil.

MANGROVES

absorb carbon dioxide from the atmosphere to photosynthesize. They are extremely effective at storing carbon in their leaves, wood and roots as well as in the sediments they hold in place.

TIDAL MARSHES

are home to numerous vegetation types that store carbon in addition to securing sediments and creating carbon-rich soil.

UNDER THREAT

Blue carbon ecosystems are being degraded globally at an alarming rate of 1-2% per year, often due to coastal development, unsustainable harvesting, destructive fishing and pollution are also significant threats.

This reduces their capacity to store carbon, to support fisheries, and livelihoods or protect coastal communities – ultimately turning these key ecosystems from carbon sinks into sources of atmospheric carbon.

PROTECTION & RESTORATION

Protection and restoration of blue carbon ecosystems is crucial for humanity on a local and global scale. IBC is working with conservation partners and communities to achieve this, using science to contribute to the development of solutions including Marine Protected Areas and blue carbon credit systems. These efforts are supported by IBC's real conservation work, as healthy local reefs support productivity and biomass of blue carbon ecosystems.

Ecosystem-Based Fisheries Management Jason S. Link, Anthony R. Marshak, 2021-11-15 Ecosystem based fishery management EBFM is rapidly becoming the default approach in global fisheries management The clarity of what EBFM means is sharpening each year and there is now a real need to evaluate progress and assess the effectiveness and impacts By examining a suite of over 90 indicators including socioeconomic governance environmental forcing major pressures systems ecology and fisheries criteria for 9 major US fishery ecosystem jurisdictions the authors systematically track the progress the country has made towards advancing EBFM and making it an operational reality The assessment covers a wide range of data in both time multiple decades and space from the tropics to the poles representing over 10% of the world's ocean surface area The authors view progress towards the implementation of EBFM as synonymous with improved management of living marine resources in general and highlight the findings from a national perspective Although US centric the lessons learned are directly applicable for all parts of the global ocean Much work remains but significant progress has already been made to better address many of the challenges facing the sustainable management of our living marine resources This is an essential and accessible reference for all fisheries professionals who are currently practicing or progressing towards ecosystem based fisheries management It will also be of relevance and use to researchers teachers managers and graduate students in marine ecology fisheries biology biological oceanography global change biology conservation biology and marine resource management

The Earth as a Distant Planet M. Vázquez, E. Pallé, P. Montañés Rodríguez, 2010-03-12 In *The Earth as a Distant Planet* the authors become external observers of our solar system from a distance and try to determine how one can understand how Earth the third in distance to the central star is essentially unique and capable of sustaining life The knowledge gained from this original perspective is then applied to the search for other planets outside the solar system or exoplanets Since the discovery in 1992 of the first exoplanet the number of planet detections has increased exponentially and ambitious missions are already being planned for

the future The exploration of Earth and the rest of the rocky planets are Rosetta stones in classifying and understanding the multiplicity of planetary systems that exist in our galaxy In time statistics on the formation and evolution of exoplanets will be available and will provide vital information for solving some of the unanswered questions about the formation as well as evolution of our own world and solar system Special attention is paid to the biosignatures signs of life detectable in the Earth s reflected spectra and the search for life in the universe The authors are experts on the subject of extrasolar planets They provide an introductory but also very much up to date text making this book suitable for researchers and for advanced students in astronomy and astrophysics
