Electric Vehicle Structures Components:

Electric Vehicle Structures and Components Philip Terpstra, 1993-12-01 **ELECTRIC VEHICLE STRUCTURES COMPONENTS** is a technical book written in laymen's terms describing the technology used in battery powered passenger vehicles. The book gives comprehensive descriptions of electric storage batteries presently being used as well as those being developed that have potential for use in EVs. Electric Vehicles: A discussion of electric motors AC DC brushless etc is given along with some of the advantages/disadvantages of each type. Materials suitable for EV construction are discussed including the benefits/drawbacks of each. Such materials include fiberglass kevlar graphite aluminum. The book weighs the pros/cons of the various materials/products in terms of their impact on the natural environment. Such considerations include the procurement of the materials, mining, deforestation etc, their positive effect in terms of increasing the energy efficiency of EVs, the ease with which the materials can be reused or recycled after the vehicle is taken out of service. This book is of immense value to electric vehicle technicians as well as ordinary car drivers who wish to know about positive changes they can make in favor of the natural environment on which we all depend. The book aims to foster an understanding of how these vehicles contribute to the shift towards green energy. Drawing from extensive data collected from over 20 cities, 40 companies and more than 500 questionnaires, the book offers practical information for policymakers and industry stakeholders. Beyond the technological aspects such as battery technology, electric drive systems and charging infrastructure, the book also discusses policy support mechanisms, financial subsidies, tax incentives and regulatory frameworks. It includes international case studies from the USA and UK, aiding readers in grasping the global dynamics and fostering international cooperation. The book is essential for understanding the interplay between new energy vehicles and energy transition, providing actionable insights for industry professionals, researchers and policymakers. **Presents comprehensive insights into the current Chinese approach to the new energy vehicle industry. Highlights technological innovation as the core driving factor in business model innovation, aligning with the rapidly evolving nature of new energy vehicles and their reliance on technological breakthroughs in battery systems, energy storage and charging infrastructure. Includes case study comparisons to new energy vehicle industry development in other countries and in global policy development.** **Structural Transitions to Electric Vehicle Production** Stephen Ayerst, Neree C.G.M. Noumon, 2023-02-28. Sustaining the impressive convergence gains allowed by the Czech automotive sector has become challenging due to its comparatively lower value added, lower investments in research and development and lower skills in the labor market. Using a structural model of global value chains, the paper examines policies to smooth the transition to the production of electric vehicles in Czechia. The analysis explores

the impacts of increasing labor productivity boosting production capabilities and moving up the global value chain These policies were found to have a relatively lower impact when they shift specialization towards lower value added stages of production
