Electromagnetic Fields and Life A. Presman, 2013-06-29 A broad region of the electromagnetic spectrum long assumed to have no influence on living systems under natural conditions has been critically re examined over the past decade This spectral region extends from the superhigh radio frequencies through decreasing frequencies to and including essentially static electric and magnetic fields The author of this monograph A S Presman has reviewed not only the extensive Russian literature but also almost equally comprehensively the non Russian literature dealing with biological influences of these fields Treated also is literature shedding some light on possible theoretical foundations for these phenomena A substantial rapidly increasing number of studies in many laboratories and countries has now clearly established biological influences which are independent of the theoretically predictable simple thermal effects Indeed many of the effects are produced by field strengths very close to those within the natural environment The author has even more importantly set forth a novel imaginative general hypothesis in which it is postulated that such electromagnetic fields normally serve as conveyors of information from the environment to the organism within the organism and among organisms He postulates that in the course of evolution organisms have come to employ these fields in conjunction with the well known sensory nervous and endocrine systems in effecting coordination and integration
