Introduction To Electromagnetic Theory Ram Kripal,

2021-02-02 The book is intended to emphasize the aspects of electromagnetism which are most important for the modern student as a background both for experimental physics and for the quantum theory of matter and radiation The emphasis is on physical theory as developed from fundamental empirical laws rather than on mathematics and internal logic Thus Maxwell's equations are obtained from the experimental laws of Coulomb Ampere and Faraday instead of postulated initially The physical concepts come out more clearly in this way and the approach represents the manner in which physical

theory evolves The introduction of electrodynamic potentials and the solution of the wave equation are treated conventionally Rationalized MKS units are used because the majority of modern reference books and papers are now written in this system of units I have not concentrated primarily on problem solving the heart of the matter lies in the ideas and their development Beautiful methods of calculus are used for the simplification of the subject matter References for further reading are given at the end Metamaterial-Based Optical and Radio Frequency Sensing Jun Luo,Dong Wei,Xinyu Zhang,2023-07-01 This book highlights the fundamentals and practical methods of metamaterials based optical and radio frequency sensing Combined with engineering practices the book illustrates in detail wide frequency electromagnetic signal cloaking and the detection behavior of metasurfaces including the structure of metasurfaces electric controlled behaviors layout design and fabrication methods and related experiment results This book is expected to inspire the research and development of new optical and radio frequency detectors It is suitable for researchers and engineers working on semiconductor devices applied optics and wide frequency signal detection It is also a good reference for students in these areas Nuclear Science Abstracts ,1976

McGurn,2022-06-01 Introduction to Photonic and Phononic Crystals and Metamaterials by Arthur R McGurn presents a study of the fundamental properties of optical and acoustic materials which have been of recent interest in nanoscience and device technology The level of the presentations is appropriate for advanced undergraduates beginning graduate students and researchers not directly involved in the field References are given to guide the reader to more advanced study in these fields Discussions of the physics of photonic and phononic crystals focus on the transmission properties of optical and acoustic radiation arising from their diffractive interaction in these engineered materials The frequency transmission and non transmission bands of radiation are explained in terms of the symmetry properties of the photonic and phononic artificial crystal structures Basic applications of these properties to a variety of their technological applications are examined The physics of metamaterials is discussed along with their relationships to the ideas of resonance Properties of negative index of refraction perfect lens and unusual optical effects the new optics of metamaterial media makes available are examined Related effects in acoustics are also covered Basic principles of surface acoustic and electromagnetic waves are explained These form an introduction to the fundamental ideas of the recently developing fields of plasmonics and surface acoustics *Electromagnetic Sources and Electromagnetic Fields* Gaobiao Xiao,2024-01-16 This

book presents a modified spherical harmonic expansion method in which the electromagnetic fields and their sources are expanded with the same set of spherical vector basis functions in a similar procedure Explicit expressions for the electromagnetic fields potentials energies and the related Green s functions are derived for the spherical modes in both frequency domain and time domain Based on the formulation the relationships between the electromagnetic sources the electromagnetic far fields and the electromagnetic near fields are clearly revealed In particular a nonuniform transmission line model is developed for intuitively characterizing the total radiation process The introduction of the cutoff radius and the cutoff mode degree provides a simple reference for determining the numbers of degrees of freedom of the fields associated with sources in a bounded region Based on the theory an efficient hybrid method for synthesizing antenna arrays with complex footprints is proposed and demonstrated with several numerical examples Effective algorithms are also developed for reconstructing the radiating part of the current sources This book is intended for researchers engineers and graduate students who are interested in studying the energy transfer in electromagnetic radiation synthesis and measurement of antenna arrays and applications of inverse electromagnetic source problems
