

INTRODUCTION

- Electron microscopy is a technique for obtaining high resolution images of biological and non-biological specimens.
- It is used in biomedical research to investigate the detailed structure of tissues, cells, organelles and macromolecular complexes.
- The high resolution of EM images results from the use of electrons (which have very short wavelengths) as the source of illuminating radiation.
- Electron microscopy is used in conjunction with a variety of ancillary techniques (e.g. thin sectioning, immuno-labeling, negative staining) to answer specific questions.
