Discharge Closing Switches Gerhard Schaefer, M. Kristiansen, A.H. Guenther, 2013-11-11 Pulsed power technology in the simplest of terms usually concerns the storage of electrical energy over relatively long times and then its rapid release over a comparatively short period. However, if we leave the definition at that, we miss a multitude of aspects that are important in the ultimate application of pulsed power. It is in fact the application of pulsed power technology to which this series of texts will be focused. Pulsed power in today's broader sense means special power as opposed to the traditional situation of high voltage impulse issues related to the utility industry. Since the pulsed power field is primarily application driven, it has principally an engineering flavor. Today's applications span those from materials processing such as metal forming by pulsed magnetic fields to other varied applications such as psychodetic strobe lights or radar modulators. Very high peak power applications occur in research for inertial confinement fusion, the Strategic Defense Initiative, and other historical defense uses. In fact, it is from this latter direction that pulsed power has realized explosive growth over the past half century. Early thrusts were in electrically powered systems that simulated the environment or effects of nuclear weapons detonation. More recently, it is being utilized as prime power sources for directed energy weapons such as lasers, microwaves, particle beam weapons, and even mass drivers, kinetic energy weapons.
