Fuzzy Randomness:

Fuzzy Randomness Bernd Möller, Michael Beer, 2004-02-19 The subject of the book is the comprehensive consideration of uncertainty in the numerical analysis the safety assessment and the design of structures Stochastic as well as non stochastic uncertainty is treated on the basis of the superordinated uncertainty model fuzzy randomness This new uncertainty model contains the special cases of real valued random variables and fuzzy variables and permits to take account of both uncertainty characteristics simultaneously The book introduces to the problem of uncertainty and provides a current survey of relevant uncertainty models and their application in civil engineering The necessary special mathematical basics of the fuzzy set theory and the theory of fuzzy random variables are explained in an engineering manner and illustrated by way of examples Basic ideas and methods for appropriately quantifying uncertain structural parameters are presented and demonstrated by means of characteristic examples For processing uncertainty in structural analysis safety assessment and structural design completely new algorithms are introduced and described in detail as fuzzy structural analysis fuzzy probabilistic safety assessment and fuzzy cluster design The application of the new methods is demonstrated for selected examples from civil engineering their essential advantages are emphasized For the first time this represents a coherent overall concept for considering uncertainty in civil engineering The book in particular addresses to civil engineers and requires a university degree as well as basic knowledge in stochastics But also for mechanical engineers colleagues from applied mathematics and other people who are interested in uncertainty problems the book represents a suitable introduction to the problem of uncertainty modeling and provides general solutions and algorithms which may also be applied to problems from other fields beyond engineering

Statistical Methods for Fuzzy Data Reinhard Viertl, 2011-01-25 Statistical data are not always precise numbers or vectors or categories Real data are frequently what is called fuzzy Examples where this fuzziness is obvious are quality of life data environmental biological medical sociological and economics data Also the results of measurements can be best described by using fuzzy numbers and fuzzy vectors respectively Statistical analysis methods have to be adapted for the analysis of fuzzy data In this book the foundations of the description of fuzzy data are explained including methods on how to obtain the characterizing function of fuzzy measurement results Furthermore statistical methods are then generalized to the analysis of fuzzy data and fuzzy a priori information Key Features Provides basic methods for the mathematical description of fuzzy data as well as statistical methods that can be used to analyze fuzzy data Describes methods of increasing importance with applications in areas such as environmental statistics and social science Complements the theory with exercises and solutions and is illustrated throughout with diagrams and examples Explores areas such quantitative description of data uncertainty and mathematical description of fuzzy data This work is aimed at statisticians working with fuzzy logic engineering statisticians finance researchers and environmental statisticians It is written for readers who are familiar with elementary stochastic models and basic statistical methods

Soft Methods for Handling Variability and Imprecision Didier Dubois, Maria Asuncion Lubiano, Henri Prade, María Angeles Gil, Przemyslaw Grzegorzewski, Olgierd Hryniewicz, 2008-10-01 Probability theory has been the only well founded theory of uncertainty for a long time It was viewed either as a powerful tool for modelling random phenomena or as a rational approach to the notion of degree of belief During the last thirty years in areas centered around decision theory artificial intelligence and information processing numerous approaches extending or orthogonal to the existing theory of probability and mathematical statistics have come to the front The common feature of those attempts is to allow for softer or wider frameworks for taking into account the incompleteness or imprecision of information Many of these approaches come down to blending interval or fuzzy interval analysis with probabilistic methods This book gathers contributions to the 4th International Conference on Soft methods in Probability and Statistics Its aim is to present recent results illustrating such new trends that enlarge the statistical and uncertainty modeling traditions towards the handling of incomplete or subjective information It covers a broad scope ranging from philosophical and mathematical underpinnings of new uncertainty theories with a stress on their impact in the area of statistics and data analysis to numerical methods and applications to environmental risk analysis and mechanical engineering A unique feature of this collection is to establish a dialogue between fuzzy random variables and imprecise probability theories

It covers applications in several areas including transportations and security risk assessments as well as applications related to current topics in safety and risk. Safety and Risk Modeling is a valuable resource for understanding the latest developments in both qualitative and quantitative methods of safety and risk analysis and their applications in operating environments. Each chapter has been written by active researchers or experienced practitioners to bridge the gap between theory and practice and to trigger new research challenges in safety and risk. Topics include safety engineering, system maintenance, safety in design, failure analysis, and risk concept and modelling. Postgraduate students, researchers, and practitioners in many fields of engineering, operations research, management, and statistics will find Safety and Risk Modeling a state of the art survey of reliability and quality in design and practice.

IUTAM Symposium on the Vibration Analysis of Structures with Uncertainties Alexander K. Belyaev, Robin S. Langley, 2010-12-02 The Symposium was aimed at the theoretical and numerical problems involved in modelling the dynamic response of structures which have uncertain properties due to variability in the manufacturing and assembly process with automotive and aerospace structures forming prime examples. It is well known that the difficulty in predicting the response statistics of such structures is immense due to the complexity of the structure, the large number of variables which might be uncertain, and the inevitable lack of data regarding the statistical distribution of these variables. The Symposium participants presented the latest thinking in this very active research area and novel techniques were presented covering the full frequency spectrum of low, mid, and high frequency vibration problems. It was demonstrated that for high frequency vibrations the response statistics can saturate and become independent of the detailed distribution of the uncertain system parameters. A number of presentations exploited this physical behaviour by using and extending methods originally developed in both phenomenological thermodynamics and in the fields of quantum mechanics and random matrix theory. For low frequency vibrations a number of presentations focussed on parametric uncertainty modelling, for example probabilistic models, interval analysis, and fuzzy descriptions, and on methods of propagating this uncertainty through a large dynamic model in an efficient way. At mid frequencies the problem is mixed and various hybrid schemes were proposed. It is clear that a comprehensive solution to the problem of predicting the vibration response of uncertain structures across the whole frequency range requires expertise across a wide range of areas including probabilistic and non probabilistic methods, interval and info gap analysis, statistical energy analysis, statistical thermodynamics, random wave approaches, and large scale computations, and this IUTAM symposium presented a unique opportunity to bring together outstanding international experts in these fields.

Managing Safety of Heterogeneous Systems Yuri Ermoliev, Marek Makowski, Kurt Marti, 2012-01-31 Managing safety of diverse systems requires decision making under uncertainties and risks Such systems are typically characterized by spatio temporal heterogeneities inter dependencies externalities endogenous risks discontinuities irreversibility practically irreducible uncertainties and rare events with catastrophic consequences Traditional scientific approaches rely on data from real observations and experiments yet no sufficient observations exist for new problems and experiments are usually impossible Therefore science based support for addressing such new class of problems needs to replace the traditional deterministic predictions analysis by new methods and tools for designing decisions that are robust against the involved uncertainties and risks The new methods treat uncertainties explicitly by using synthetic information derived by integration of hard elements including available data results of possible experiments and formal representations of scientific facts with soft elements based on diverse representations of scenarios and opinions of public stakeholders and experts The volume presents such effective new methods and illustrates their applications in different problem areas including engineering economy finance agriculture environment and policy making
