distances using the Tully Fisher relation etc Regarding studies of the ISM there have been a number of instrumental developments over the past decade large CCD s became available on optical telescopes radio synthesis offered sensitive imaging capabilities not only in the classical 21 cm HI line but also in the mm transitions of CO and other molecules and X ray imaging capabilities became available to measure the hot component of the ISM These developments meant that Milky Way was no longer the exclusive playground for ISM studies and that by reaching out to other galaxies astronomy had gained the advantage of having an outside view though at the expense of giving up some linear resolution Studies of the ISM in other galaxies are intimately connected to studies of the ISM in the Milky Way

The Mass of Galaxies at Low and High Redshift Ralf Bender, 2003-01-23 Measuring the masses of galaxies as a function of redshift is perhaps one of the most challenging open issues in current astronomical research The evolution of the baryonic and dark matter components of galaxies is not only a critical test of the hierarchical formation paradigm but ultimately also provides new clues on the complex interplay between star formation the cooling and heating of gas and galaxy merging processes This book reviews current techniques to measure the baryonic stellar and dark masses of nearby galaxies and focusses on ongoing attempts to measure theses same quantities in galaxies at higher and higher redshifts It also gives room to future perspectives with special emphasis on new survey projects and satellite missions
