mechanisms of spermatogenesis sperm maturation and fertilization provide the basis of our understanding of male reproductive physiology Since in recent years molecular and cellular endocrinology has provided particularly important contributions to our knowledge the European Workshops on Molecular and Cellular Endocrinology of the Testis held regularly during even years since 1980 have become a prominent forum for researchers in the field to discuss recent findings and exchange new ideas The most recent of these Testis Workshops the 7th was held on May 5-10 1992 at Castle Elmau in the Bavarian Alps The main lectures of this Workshop form the core of this book In order to provide a broader view of the current status of male reproduction research this volume also contains the proceedings of the Schering Foundation Workshop on Basic Mechanisms of Reproduction and Male Fertility Control which was held in Berlin on October 31 to November 2 1991 The topics of the two meetings were planned to complement each other By combining the proceedings of both workshops it became possible to produce a book that covers a wide spectrum of current highlights in male reproduction research and provides the reader with an up to date review of the field The timeliness of the book is emphasized by the fact that it was already available when the 7th European Testis Workshop took place

**The Baboon in Biomedical Research** John L. VandeBerg, Sarah Williams-Blangero, Suzette D. Tardif, 2009-06-04 Nonhuman primates have played critical roles in biomedical research and they are among the few animals whose use in research continues to increase The scientific value of nonhuman primates derives from their close phylogenetic proximity to man and their consequent anatomic physiologic and genetic similarities to man Only nonhuman primates can provide adequate models for many complex physiological and disease processes of humans The baboon is a relative newcomer to the repertoire of nonhuman primates used in biomedical research However in less than 50 years since its first use in the U S it has become one of the most popular laboratory primate species It is larger than the other widely used monkey species making it advantageous for many types of experiments and technological developments It is extraordinarily hardy and highly fecund in captivity It closely resembles humans in a variety of physiological and disease processes such as cholesterol metabolism early stages of atherosclerosis and alcoholic liver disease Its chromosomes closely resemble those of humans and many genes of the two species lie in the same chromosomal order Among all primates baboons are the most widely used models for the genetics of susceptibility to complex diseases and they are the first nonhuman primate for which a framework genetic linkage map was established In addition the baboon genome is currently being sequenced and as a result the utility of this species for biomedical research will be dramatically increased
