

Angular correlation

- If nuclear spins can be aligned in one direction, angular distribution of emitted γ -ray intensity would depend on initial nuclear spin and multipole character of radiation
 - Align nuclei in magnetic or electric field at near 0 K
 - observe a γ ray in coincidence with a preceding radiation
 - Alpha, beta, or gamma
- coincidence experiment
 - angle θ between two sample-detector axes is varied, coincidence rate will vary as a function of θ

Correlation function: $W(\theta) = 1 + a_2 \cos^2 \theta + a_4 \cos^4 \theta$

$$A = \frac{W(180^\circ) - W(90^\circ)}{W(90^\circ)} \quad \text{where } A = a_2 + a_4 \text{ (fits)}$$

Broude, M. A. Eswaran, 1960 [Angular Correlations in Nuclear Disintegration](#) Hans van Krugten, Bob van Nooijen, 2012-12-06 In 1969 we felt that the subject of angular correlations in nuclear disintegration had received little special attention at international conferences It is true that perturbed angular correlations had been discussed at a small highly specialised meeting at Uppsala in 1963 and that in 1967 certain aspects of perturbed angular correlations had been considered at a conference on hyperfine structure at Asilomar However both conferences were very limited in scope from the point of view of a low energy nuclear physicist Besides since these conferences were being held the field of perturbed angular correlations had received new impetus from the still expanding application of the implantation of radioactive isotopes in suitable environments from the construction of large superconductive magnets etc Meanwhile the

technique of measuring correlations between beta particles and circularly polarized gamma rays had been developed to such a degree that they lent themselves to the investigation of beta decay nuclear structure and charge dependence of nuclear forces. The systematic study of heavy elements had increased the importance of alpha gamma angular correlations which present their own specific problems. Theoretical internal conversion data had become available to such an extent that electron gamma directional correlations became an important tool in the investigation of nuclear structure in a large number of cases it is more advantageous to study electron gamma correlations instead of the commonly measured gamma gamma directional correlations.

Watson, AEROSPACE RESEARCH LABS WRIGHT-PATTERSON AFB OHIO., Aerospace Research Laboratories (U.S.), 1967 This report contains a description and listing of computer programs useful in the analysis of data on intensity direction correlations of successive radiative transitions from aligned nuclei. A brief discussion of the methods used in extracting energy level spins population parameters and multipolarity mixing ratios from intensity direction correlation measurements is given. The methods provide for simultaneous analysis of angular distribution and triple correlation measurements and can be used for the analysis of double and triple correlation measurements where multi step cascades involving intermediate unobserved transitions occur. The computer programs described are written in FORTRAN IV for use on an IBM 7094 II computer. The complete program listings are included together with flow charts. Listings of sample input to and output from the programs are given. In addition a description and listing is given of a program for the calculation of correction factors for finite geometry effects.
