M.G. SIMPSON and P.J. RUDALL

Tecophilaeaceae Leyb., Bonplandia 10: 370 (1862), nom. cons.  
Cynastraceae Engler (1900).

Erect, perennial, terrestrial herbs. Roots fibrous. Subterranean stem a globose to ellipsoid corm, 1–4 cm in diameter, in some genera with a membranous to fibrous tunic consisting of persistent sheathing leaves or fibrovascular bundles. Leaves basal to subbasal, or cauline in *Walleria*, spiral; base sheathing or non-sheathing, blades narrowly linear to lanceolate-ovate, or more or less petiolate in *Cyanastrum* and *Kabuyea*; entire, glabrous, flat, or marginally undulate; venation parallel with a major central vein. Flowers terminal and either solitary (or in small groups) and a panicle or (in *Walleria*) solitary in the axils of cauline leaves. Bracts and bracteoles (prophylls) often present on pedicel. Flowers 1–3 cm long, pedicellate, bisexual, trimerous. Perianth variable in color, zygomorphic or actinomorphic, homochlamydeous, basally syntepalous; perianth lobes 6, imbricate in 2 whorls, the outer median tepal positioned anteriorly; minute corona appendages present between adjacent stamens in some taxa. Androeceum arising at mouth of perianth tube, opposite the tepals and either actinomorphic or zygomorphic, composed of either 6 fertile stamens or combinations of fertile stamens and staminodes; fertile stamens similar in size and shape or dimorphic, oriented equally in a circle or oriented in anterior and posterior groups. Fertile anthers 2-locular, poricidally dehiscent (or almost so). Gynoeceum syncarpous; ovary semiinferior to almost superior; carpels and locules 3; placentation axile; ovules 2 to numerous per carpel. Fruit a loculicidal capsule. Seeds ranging from yellow to brown to black, and of varied size and shape.

Eight genera, ca. 23 species, Chile, southern and tropical Africa, Madagascar, and California.

**VEGETATIVE MORPHOLOGY.** All genera of Tecophilaeaceae have a subterranean, oblate to globose corm, 1–4 (generally 2) cm in diameter. In five genera (*Conanthera*, *Cyanella*, *Odontostomum*, *Tecophilaea*, and *Zephyra*) the corm is enveloped by a tunica, which consists of membranous to

fibrous scale leaves or leaf bases or the reticulate fibrovascular remains of these scale leaves (Fig. 123). The tunic often continues above the corm, in some cases forming an apical tuft. Corms of *Walleria*, *Cyanastrum*, and *Kabuyea* lack a corm tunic (Fig. 122).

Leaves are bifacial and spirally arranged. Leaf venation is parallel, with 1 major central vein. Photosynthetic leaves of some genera are basal to subbasal with a tubular sheath surrounding the base of the aerial stem axis. One or 2 sheathing non-photosynthetic leaves are sometimes present at the base of the photosynthetic leaves. Leaf blades are glabrous, entire, flat or marginally undulate and are very narrowly linear, lanceolate, or lanceolate-ovate in shape, or more or less petiolate in *Cyanastrum* and *Kabuyea*. *Walleria* differs in having cauline photosynthetic leaves (basal leaves being absent) which are equally inserted along the aerial stem. Leaves of *Walleria* are sessile, lanceolate, entire, glabrous, and scabrous on the abaxial midrib.

Tillich (1995) described seedling structure in *Cyanastrum cordifolium*, *Cyanella*, and *Walleria*. In *Cyanella* and *Walleria* there is a haustorial hyperphyll, a short tubular sheath and a coleoptile, which becomes very long in *Cyanella*. In *Cyanastrum cordifolium* the hypocotyl and pri-

**Research Methods** F.T. Short,R.G. Coles,2001-11-06 This thorough and informative volume presents a set of detailed globally applicable techniques for seagrass research The book provides methods for all aspects of seagrass science from basic plant collection to statistical approaches and investigations of plant animal interaction The emphasis is on methods that are applicable in both developing and developed countries The importance of seagrasses in coastal and near shore environments and ultimately their contribution to the productivity of the world s oceans has become increasingly recognised over the last 40 years Seagrasses provide food for sea turtles nearly 100 fish species waterfowl and for the marine mammals the manatee and dugong Seagrasses also support complex food webs by virtue of their physical structure and primary production and are well known for their role as breeding grounds and nurseries for important crustacean finfish and shell fish populations Seagrasses are the basis of an important detrital food chain The plants filter nutrients and contaminants from the water stabilise sediments and act as dampeners to wave action Seagrasses rank with coral reefs and mangroves as some of the world s most productive coastal habitat and strong linkages among these habitats make the loss of seagrasses a contributing factor in the degradation of the world s oceans Contributors from around the world provide up to date methods for comparable collection of ecological information from both temperate and tropical seagrass ecosystems

*Seagrasses: Biology, Ecology and Conservation* Anthony W. D. Larkum,Robert J.
