## **Floodplain Processes:**

*Floodplain Processes* Malcolm G. Anderson, 1996-10-21 River floodplains represent a most important component of the environment. They play a critical role in the routing and storage of floodwaters and frequently represent unique and valuable habitats. Increasingly such areas are under pressure from human activity in a wide variety of forms. This volume seeks to outline recent major research developments that have taken place in the study of floodplain processes. The chapters represent the results of recent engineering, geomorphological, hydrological, planning and other specialist developments. The book will contribute to research not only within the specialist research disciplines outlined but also in the more interdisciplinary challenges facing river management.

Floodplains Jeffrey J. Opperman, Peter B. Moyle, Eric W. Larsen, Joan L. Florsheim, Amber D. Manfree, 2017-09-05 *Floodplains* provides an overview of floodplains and their management in temperate regions. It synthesizes decades of research on floodplain ecosystems, explaining hydrologic, geomorphic and ecological processes and how, under appropriate management, these processes can provide benefits to society ranging from healthy fish populations to flood risk reduction. Drawing on the framework of reconciliation ecology, the authors explore how new concepts for floodplain ecosystem restoration and management can increase these benefits. Additionally, they use case studies from California's Central Valley and other temperate regions to show how innovative management approaches are reshaping rivers and floodplains around the world.

**Geomorphic Approaches to Integrated Floodplain Management of Lowland Fluvial Systems in North America and Europe** Paul F. Hudson, Hans Middelkoop, 2015-04-29 This volume provides a comprehensive perspective on geomorphic approaches to management of lowland alluvial rivers in North America and Europe. Many lowland rivers have been heavily managed for flood control and navigation for decades or centuries, resulting in engineered channels and embanked floodplains with substantially altered sediment loads and geomorphic processes. Over the past decade, floodplain management of many lowland rivers has taken on new importance because of concerns about the potential for global environmental change to alter floodplain processes, necessitating revised management strategies that minimize flood risk while enhancing environmental attributes of floodplains influenced by local embankments and upstream dams. Recognition of the failure of old perspectives on river management and the need to enhance environmental sustainability has stimulated a new approach to river management. The manner that river restoration and integrated management are implemented, however, requires a case study approach that takes into account the impact of historic human impacts on the system, especially engineering. The river basins examined in this volume provide a representative coverage of the drainage of North America and Europe, taking into account a range of climatic and physiographic provinces. They include the 1 Sacramento, California, USA; 2 San Joaquin, California; 3 Missouri, Missouri, USA; 4 Red, Manitoba, Canada; and Minnesota, USA; 5 Mississippi, Louisiana, USA; 6 Kissimmee, Florida, USA; 7 Ebro,

Spain 8 Rhone France 9 Rhine Netherlands 10 Danube Romania and 11 Volga Russian Federation Rivers The case studies covered in these chapters span a range of fluvial modes of adjustment including sediment channel hydrologic regime floodplains as well as ecosystem and environmental associations

**Flood and Megaflood Processes and Deposits I.** Peter Martini, Victor R. Baker, Guillermina Garzón, 2009-03-05 The aim of this publication is the understanding of large floods and their impact on the Earth's surface The major objectives are 1 to take a second look at what constitutes a megaflood that the principle of uniformitarianism is at some loss to explain and 2 to try to determine what could happen in such large floods by analyzing those that occur in front of glaciers in alluvial fans and in alluvial valleys The products of these floods are presented in terms of sedimentary deposits erosional features and damage to human activities The volume bears out the concept that sedimentological analysis can be a powerful tool not only for reconstructing processes that have acted on ancient landscapes but also as a technique for risk assessment of certain troubled areas Therefore this volume is of interest not only to sedimentologists geomorphologists but also to engineers landuse planners and anyone interested in the interrelation between humans and the environment If you are a member of the International Association of Sedimentologists for purchasing details please see <http://www.iasnet.org/publications/details.asp?code=SP32>

River Dynamics Bruce L. Rhoads,2020-04-29 Rivers are important agents of change that shape the Earth s surface and evolve through time in response to fluctuations in climate and other environmental conditions They are fundamental in landscape development and essential for water supply irrigation and transportation This book provides a comprehensive overview of the geomorphological processes that shape rivers and that produce change in the form of rivers It explores how the dynamics of rivers are being affected by anthropogenic change including climate change dam construction and modification of rivers for flood control and land drainage It discusses how concern about environmental degradation of rivers has led to the emergence of management strategies to restore and naturalize these systems and how river management techniques work best when coordinated with the natural dynamics of rivers This textbook provides an excellent resource for students researchers and professionals in fluvial geomorphology hydrology river science and environmental policy

*Geomorphic Analysis of River Systems* Kirstie A. Fryirs,Gary J. Brierley,2012-09-26 Filling a niche in the geomorphology teaching market this introductory book is built around a 12 week course in fluvial geomorphology Reading the landscape entails making sense of what a riverscape looks like how it works how it has evolved over time and how alterations to one part of a catchment may have secondary consequences elsewhere over different timeframes These place based field analyses are framed within their topographic climatic and environmental context Issues and principles presented in the first part of this book provide foundational understandings that underpin the approach to reading the landscape that is presented in the second half of the book In reading the landscape detective style investigations and interpretations are tied to theoretical and conceptual principles to generate catchment specific analyses of river character behaviour and evolution including responses to human disturbance This book has been constructed as an introductory text on river landscapes providing a bridge and or companion to quantitatively framed or modelled approaches to landscape analysis that are addressed elsewhere Key principles outlined in the book emphasise the importance of complexity contingency and emergence in interpreting the character behaviour and evolution of any given system The target audience is second and third year undergraduate students

in geomorphology hydrology earth science and environmental science as well as river practitioners who use geomorphic understandings to guide scientific and or management applications The primary focus of Kirstie and Gary s research and teaching entails the use of geomorphic principles as a tool with which to develop coherent scientific understandings of river systems and the application of these understandings in management practice Kirstie and Gary are co developers of the River Styles Framework and Short Course that is widely used in river management decision making and training Additional resources for this book can be found at [www.wiley.com/go/fryirs\\_riversystems](http://www.wiley.com/go/fryirs_riversystems) Contaminated Rivers Jerry R. Miller, Suzanne M. Orbock Miller, 2007-05-06 This book provides an introductory understanding of fluvial geomorphic principles and how these principles can be integrated with geochemical data to cost effectively characterize assess and remediate contaminated rivers The book stresses the importance of needing to understand both geomorphic and geochemical processes Thus the overall presentation is first an analysis of physical and chemical processes and second a discussion of how an understanding of these processes can be applied to specific aspects of site assessment and remediation Such analyses provide the basis for a realistic prediction of the kinds of environmental responses that might be expected for example during future changes in climate or land use
