Flight Signals:

Flight Test Identification and Simulation of a UH-60A Helicopter and Slung Load ,2001 Helicopter slung load operations are common in both military and civil contexts Helicopters and loads are often qualified for these operations by means of flight tests which can be expensive and time consuming There is significant potential to reduce such costs both through revisions in flight test methods and by using validated simulation models To these ends flight tests were conducted at Moffett Field to demonstrate the identification of key dynamic parameters during flight tests aircraft stability margins and handling qualities parameters and load pendulum stability and to accumulate a data base for simulation development and validation The test aircraft was a UH 60A Black Hawk and the primary test load was an instrumented 8 by 6 by 6 ft cargo container Tests were focused on the lateral and longitudinal axes which are the axes most affected by the load pendulum modes in the frequency range of interest for handling qualities tests were conducted at airspeeds from hover to 80 knots Using telemetered data the dynamic parameters were evaluated in near real time after each test airspeed and before clearing the aircraft to the next test point These computations were completed in under 1 min A simulation model was implemented by integrating an advanced model of the UH 60A aerodynamics dynamic equations for the two body slung load system and load static aerodynamics obtained from wind tunnel measurements Comparisons with flight data for the helicopter alone and with a slung load showed good overall agreement for all parameters and test points however unmodeled secondary dynamic losses around 2 Hz were found in the helicopter model and they resulted in conservative stability margin estimates *Flight Information Manual* ,1946 *Language Signs and Calming Signals of Horses* Rachaël
