In Search of Prosperity Dani Rodrik, 2012-11-21

The economics of growth has come a long way since it regained center stage for economists in the mid 1980s Here for the first time is a series of country studies guided by that research The thirteen essays by leading economists shed light on some of the most important growth puzzles of our time How did China grow so rapidly despite the absence of full fledged private property rights What happened in India after the early 1980s to more than double its growth rate How did Botswana and Mauritius avoid the problems that other countries in sub Saharan Africa succumbed to How did Indonesia manage to grow over three decades despite weak institutions and distorted microeconomic policies and why did it suffer such a collapse after 1997 What emerges from this collective effort is a deeper understanding of the centrality of institutions Economies that have performed well over the long term owe their success not to geography or trade but to institutions that have generated market oriented incentives protected property rights and enabled stability However these narratives warn against a cookie cutter approach to institution building The contributors are Daron Acemoglu Maite Careaga Gregory Clark J Bradford DeLong Georges de Menil William Easterly Ricardo Hausmann Simon Johnson Daniel Kaufmann Massimo Mastruzzi Ian W McLean Lant Pritchett Yingyi Qian James A Robinson Devesh Roy Arvind Subramanian Alan M Taylor Jonathan Temple Barry R Weingast Susan Wolcott and Diego Zavaleta

This theme is organized into several different topics and introduces the applications of mathematics to economics. Mathematical economics has experienced rapid growth, generating many new academic fields associated with the development of mathematical theory and computer mathematics. Mathematics is the backbone of modern economics. It plays a basic role in creating ideas, constructing new theories, and empirically testing ideas and theories. Mathematics is now an integral part of economics. The main advances in modern economics are characterized by applying mathematics to various economic problems. Many of today's profound insights into economic problems could hardly be obtained without the help of mathematics. The concepts of equilibrium versus non-equilibrium, stability versus instability, and steady states versus chaos in the contemporary literature are difficult to explain without mathematics. The theme discusses on modern versions of some classical economic theories, taking account of balancing between significance of economic issues and mathematical techniques. These two volumes are aimed at the following five major target audiences: University and College students, Educators, Professional practitioners, Research personnel, and Policy analysts, managers, and decision makers, and NGOs.
