Emerging Insect Pests of Vegetable Crops under Changing Climate Scenario

Pratap A. Divekar^{*}, Jaydeep Halder, Kuldeep Srivastava and V. Sridhar[†]

Abstract

Crop losses in vegetables vary greatly depending on plant variety, cropping season, geographical location, and pest damage potential. Vegetable crops are heavily impacted by insect pests and diseases due to their softness, fragility and short duration in comparison to other crops. An emerging insect pest is one that has been observed in a specific crop-infested area and has progressively increased in population over time. Emerging insect pests have the potential to cause economic harm. In other words, an emerging insect pest is a pest insect whose position has shifted from minor to major or secondary to primary pest. The number of existing minor pests is increasing, as is the arrival of new ones, such as mealybugs, fruit flies, stem borers, diamondback moths among phytophagous insects and red spider mites among acarine. Recent infestations, such as South American tomato pinworm and chili black flower thrips, have caused serious damage to tomato and chili harvests. This review envisages on the variables that contribute to the establishment of new invasive pests, the persistence of main pests, general pest management practices, and integrated pest management to achieve sustainable vegetable production.

Introduction

Indian vegetables are recognized for their broad range of colors, shapes, and sizes. Globally, around 1097 different vegetables are grown for human consumption. These veggies are low-cost sources of vitamins and nutrients that provide farmers with both on- and off-farm revenue. Vegetables high in fibre enhance digestion, lower cholesterol, and reduce the risk factors for heart disease, diabetes, and obesity. Although India was second in vegetable output after China, the yield of numerous vegetables is still considerably below the global average. One of the primary factors for reaching this goal is biotic stresses like insect and acarine pests, diseases, nematodes and weeds. Insect pests alone cause crop losses on an average 25 to 30% yield loss in vegetables (Rai et al. 2014a). Apart from direct losses many of them also serve as many plant diseases which aggravate the problem further (Kodandaram et al., 2017b). The yield losses due to insect pest in different vegetables are listed as follows:

Sustainable vegetable production can be achieved through the management of insect pests in an eco-friendly way. The eco-friendly and sustainable pest management options like Cultural control (Halder et al., 2023), host plant resistance (HPR) (Divekar et al. 2019), plant secondary metabolites (Divekar et al. 2022), bio-control agents (Divekar P. 2023; Dukare et al. 2021), defense proteins (Divekar et al. 2022) and finally the chemical control (Kodandaram et

Advances in Research on Vegetable Production Under a Changing Climate Vol. 2 Shashank Shekhar Solankey, Meenakshi Kumari, 2023-01-01 This second volume on the topic will be extremely useful for the researchers and postgraduate students working on vegetable crops with a special focus on climate change. Today the entire world is suffering from global warming and its consequent climate change. This has emerged as the most prominent global environmental issue and there is an urgent need to mitigate its impact on agriculture. Over the past 20 years South Asia has had a robust economic growth yet it is home to more than one fourth of the world's hunger and 40% of the world's malnourished children and women. Persistent climatic variability which results in frequent drought and flood is among the major reasons for this phenomenon. Vegetables are in general more succulent, have 90% water and are more sensitive to climatic vagaries and sudden changes in temperature as well as irregular precipitation at any phase of crop growing can affect the normal growth, flowering, pollination, fruit setting, fruit development and fruit ripening which eventually decreases the yield. The irregular precipitation also causes the soil salinity and is a major challenge in many vegetable growing areas. To mitigate the harmful impact of climatic change, there is an urgent need to develop adequate adaptation strategies for adverse effect of climate change and preference should be given to the development of heat, cold, drought, flood and salinity stress tolerant genotypes along with climate proofing through conventional and non-conventional breeding techniques as well as exploiting the beneficial effects of CO₂ enhancement on crop growth and yield. Available evidence shows that there is high probability of increase in the frequency and intensity of climate-related natural hazards due to climate change and hence increase the potential threat due to climate change-related natural disasters in the world. At present protected cultivation and grafted seedlings are also popularizing among vegetable growers because of the huge scope as well as molecular breeding, emerging insect pests, diseases and postharvest quality of vegetables under this climate change scenario. Moreover, underexploited vegetables, perennial vegetable and tuber crops have a more tolerant ability to climate vagaries compared to major vegetables which are also discussed in this book.

Ecologically Based Integrated Pest Management D. P. Abrol, Uma Shankar, 2012 The availability of modern tools and transgenic crop

protection technology has opened new vistas in the vast field of pest management All these issues form the focus of the book where they have been discussed by eminent scientists who are authority in their respective fields The book describes the science and art of integrated pest management It contains 48 chapters grouped into six sections which include topics ranging from Impact on food security Breeding for resistance IPM in crops fruits vegetables Future strategies and policy issues IPR related issues It also gives detailed information on emerging strategies and problems such as the role of biotechnology and the implications of IPR issues The roles of IPM in sustaining food productivity contribution of IPM in meeting economic environmental and social costs have been elaborated The role of diagnostic tools weather forecasting transgenic plants biological control and new chemicals in future IPM programmes and strategies to meet the challenges of pest adaptation have been highlighted The need for improved information transfer implementation and application of IPM has been discussed Finally it is essential to know the status of IPM its future challenges and constraints which have been extensively elaborated in the last chapter of this book The book intends to fill the gap by providing the critical analysis of different management strategies having bearing on agriculture sustainability and environmental protection The compilation of this book is unique in the sense that it does not deal with the conventional way of discussing pest management with respect to particular crops or the regions It emphasizes on the other hand an overview of the management strategies with critical evaluation of each in the larger context of ecologically based pest management

Plant Genetic Resources B. S. Dhillon, 2005 The agricultural paradigm is already undergoing a shift in focus from food security towards nutritional quality Horticultural crops besides improving biological productivity and nutritional standards also have enormous export potential This group of crops comprising fruits vegetables root and tuber crops plantation crops medicinal and aromatic plants spices and condiments and ornamental crops would constitute core of any such agro economic strategy In addition to supplementing the economy and national food grid by providing fresh and processed fruits vegetable nuts etc horticultural crops also help to promote diversification Depletion of plant genetic resources in areas of diversity at a rapid pace is a matter of global concern This book profiles all scientific management aspects of the horticultural crop genetic resources including their diversity conservation and sustainable utilization It also addresses vital concerns regarding management of horticultural crop genetic resources from diverse perspectives and provides recommendations for action in certain areas of research that must be pursued with intensity The publication would serve as a valuable comprehensive scientific reference for breeders researchers teachers students and policy makers in biology and agriculture
