

EVOLUTION OF STARS

After 10 billion years, the small star will run out of hydrogen and starts fusing helium, which causes the star to expand to a red giant

Planetary Nebula

After the star runs out of helium, the star will try to combine carbon, which the star can't combine. So the gas spreads apart from the star leaving behind a carbon dense white dwarf.

White Dwarf

When the white dwarf runs out of its remaining energy, it loses its brightness and becomes a brown dwarf.

After the star explodes, the star can do two different things based on its size

1. It can form a very dense NEUTRON STAR
2. It can form the most densest object in the universe, a BLACK HOLE

When a massive star runs out of hydrogen, it expands and will make all kind of elements until it starts forming Iron

Symposium, 2006-06-15 For the last 40 years astronomers have observed sources of

intense X ray radiation from beyond our Solar System These have been associated with remarkable objects such as neutron stars and black holes Current satellite observatories have enabled us to extend the studies of these objects from the Milky Way and Magellanic Clouds to individual X ray sources in other galaxies At the same time imaging facilities at gamma rays and TeV energies have improved enormously leading to many further discoveries within our own galaxy This Symposium presents an overview of these new developments covering detailed studies of individual sources within the Milky Way global descriptions of X ray source populations in other galaxies and less resolved relatives at high redshift Galaxy nuclei and diffuse emission components are included as are new discoveries at gamma rays and TeV energies IAU S230 is a valuable resource for astronomers and graduates working in high energy astrophysics **Cosmic Dust, Its Impact on Astronomy**
