Amino Acids in Nutrition and Health Guoyao Wu, 2021-03-26 Amino acids AAs are not only building blocks of protein but are also signalling molecules as well as regulators of gene expression and the protein phosphorylation cascade Additionally AAs are key precursors for syntheses of hormones and low molecular weight nitrogenous substances with each having enormous biological importance For example physiological concentrations of AA metabolites e.g. nitric oxide polyamines glutathione taurine thyroid hormones and serotonin are required for cell functions Growing evidence shows that humans and animals have dietary requirements for all proteinogenic AAs Mammals birds and fish also have species and age dependent needs for

some AA related substances However elevated levels of other products e g ammonia homocysteine H₂S and asymmetric dimethylarginine are pathogenic factors for neurological disorders oxidative stress and cardiovascular disease Thus optimal amounts of AAs and their ratios in diets and circulation are crucial for whole body homeostasis and health Adequate provision of one or a mixture of functional AAs or metabolites may be beneficial for ameliorating health problems at various stages of the life cycle e g fetal growth restriction neonatal morbidity and mortality weaning associated intestinal dysfunction and wasting syndrome obesity diabetes cardiovascular disease the metabolic syndrome and infertility Dietary supplementation of these nutrients can also optimize the efficiency of metabolic transformations to enhance muscle growth milk production and athletic performance while preventing excess fat deposition and reducing adiposity Therefore functional AAs hold great promise in improving the growth health and well being of individuals Chapter 7 is available open access under a Creative Commons Attribution 4.0 International License via link [springer.com](https://www.springer.com)
