Elektrische Leitungsphänomene I / Electrical Conductivity I S. Flügge, 1956-01-02 191 Apart from numerous difficulties arising from the high pressure technique as such there is a natural limitation to the possibility of applying a hydrostatic pressure since liquids under pressure will solidify above a certain pressure limit 8 2 Up to pressures of 3×10^4 kg/jm at room temperature a liquid like isopentane can be used For higher pressures helium gas may be used perhaps to about 9×10^4 kg/jm but BRIDGMAN already encountered enormous leakage difficulties 7 when using this gas at 7×10^4 kg/jm at 90 K A solution has been found by applying mechanical pressure for the range 8 9 2 between 3×10^4 and 10^5 kg/jm by using silver chloride as transmittant In this case however one has to apply unknown corrections for shearing stress and deformation of the sample a problem which BRIDGMAN solved experimentally by a determination of the resistivity in the pressure region between 2 and 8.25×10^4 kg/jm by the hydrostatic and by the mechanical pressure method as well and applying the correction factor thus determined to the results obtained at higher pressures Though this method seems to be right in good approximation the data for the highest pressures are to be considered as less accurate International Catalogue of Scientific Literature, 1902 **Handbuch der Physik: Elektrische Leitungsphänomene II** Siegfried Flügge, 1957

McGilp, Denis Weaire, Charles Patterson, 2012-12-06 The study of condensed matter using optical techniques where photons act as both probe and signal has a long history It is only recently however that the extraction of surface and interface information with submonolayer resolution has been shown to be possible using optical techniques where optical applies to electromagnetic radiation in and around the visible region of the spectrum This book describes these epioptic techniques which have now been quite widely applied to semiconductor surfaces and interfaces Particular emphasis in the book is placed on recent studies of submonolayer growth on well characterised semiconductor surfaces many of which have arisen from CEC DGJGII ESPRIT Basic Research Action No 3177 EPIOPTIC and CEU DGIII ESPRIT Basic Research Action No 6878 EASI Techniques using other areas of the spectrum such as the infra red region IR spectroscopy in its various surface configurations and the x ray region surface x ray diffraction x ray standing wave are omitted The optical techniques described use simple lamp or small laser sources and are thus in principle easily accessible Epioptic probes can provide new information on solid gas solid liquid and liquid liquid interfaces They are particularly suited to growth monitoring Emerging process technologies for fabricating submicron and nanoscale semiconductor devices and novel multilayer materials whether based on silicon or compound semiconductors all require extremely precise control of growth at surfaces In situ non destructive real time monitoring and characterisation of surfaces under growth conditions is needed for further progress Both atomic scale resolution and non destructive characterisation of buried structures are required Handbuch der

Lipid and Biopolymer Monolayers at Liquid Interfaces K.S. Birdi, 2013-06-29 During the past few decades much research has been reported on the formation of insoluble monomolecular films of lipids and biopolymers synthetic polymers and proteins on the surface of water or at the oil water interface This interest arises from the fact that monomolecular film studies have been found to provide much useful information on a molecular scale information that is useful for understanding many industrial and biological phenomena in chemical agricultural pharmaceutical medical and food science applications For instance information obtained from lipid monolayer studies has been useful in determining the forces that are known to stabilize emulsions and biological cell membranes The current texts on surface chemistry generally devote a single chapter to the characteristics of spread monolayers of lipids and biopolymers on liquids and a researcher may have to review several hundred references to determine the procedures needed to investigate or analyze a particular phenomenon Furthermore there is an urgent need at this stage for a text that discusses the state of the art regarding the surface phenomena exhibited by lipids and biopolymers as they are relevant to a wide variety of surface and interfacial processes **Handbuch der**
