Avian Influenza and Newcastle Disease Illaria Capua, Dennis J. Alexander, 2009-06-24 Avian Influenza AI and Newcastle Disease ND are two devastating diseases of poultry which cause losses to the poultry industry and influence the liveability of rural communities worldwide Following the H5N1 epidemic they appear to be endemic at least in Asia Eastern Europe The Middle East and Africa Particularly in case of AI outbreaks it is essential that infection is diagnosed promptly and that isolates are made available to the international scientific community Currently several organisations including OIE FAO and the EC have organised training courses in affected areas However often these courses do not cover all aspects of AI ND diagnosis but only certain aspects This results in fragmented areas of knowledge and in the application of different diagnostic protocols in different parts of the world The objective of this book is to provide a comprehensive approach to AI diagnosis ranging from the clinical elements that should trigger a suspicion in the field to the post mortem technique collection of samples processing shipment of specimens virological serological and molecular diagnosis and guidelines for notification

**Agents Transmissible from Simians to Man** Manfred Brack, 2012-12-06 The contacts between man and nonhuman primates enable the transmission of microorganisms from one species to the other Such contact may occur at quite different levels man and nonhuman primates may share the same ecosystem including the presence of vectors in the countries of origins of monkeys and apes the animals are captured to be sold or used for food field researchers have to stay near the animals in the wild an uncontrolled human population gets close enough to almost touch the animals in zoological gardens around the world pet owners establish bodily contact and finally researchers doing surgery or necropsies are exposed to an increased number of pathogens liberated from the organs and body fluids Usually monkeys and apes are more threatened with catching the microorganisms indigenous to man than vice versa but nevertheless outbreaks of true zoonoses with nonhuman primates as the source of infection have occurred Also the retransmission of originally human pathogens via nonhuman primates to man may pose a considerable risk to human health Unfortunately the information on the different agents transmissible between man and his relatives is too disseminated for practical use as it involves quite different scientific disciplines such as virology bacteriology parasitology primatology laboratory animal science etc It seemed therefore necessary to compile the current knowledge concerning this topic in a single publication Human infections of simian origin may be caused by several viruses bacteria fungi or endoparasites Ectoparasites in comparison are of little importance
