## **Characteristics and Implications of Surface Gravity Waves in the Littoral Zone of a Large Lake (Lake Constance)** Hilmar Hofmann, 2008      Global Warming

Frances Drake, 2014-05-01 This topical textbook provides a bridge between technical and popular texts on global warming within the broader context of climate change Written at an introductory level it explains the interacting components of this system what the greenhouse effect is and how scientists seek to predict climate change It makes accessible the technical and heavy science literature to the non science student Global warming is one of the major environmental problems facing the world today But it is an issue surrounded by great contention because it is based largely on scientific prediction and has yet to be proven Opinion is divided regarding whether global warming will occur and if it does what the effects will be In order to appreciate the uncertainties surrounding this issue it is necessary to understand the workings of the climate system and the methods by which scientists seek to predict climate change Global Warming aims to make accessible the heavily technical literature to the non science student providing a bridge between the highly scientific and the popular non academic texts Placing global warming within the broader context of climate change this textbook details the interacting components of the climatic system reviewing the importance of changing carbon dioxide levels for the evolution of the Earth s atmosphere and climate Utilising observed and modelled data it presents the latest evidence for and against global warming whilst highlighting the difficulties involved with analysing both types of data and introducing areas of controversy within research The book also addresses the important problem of making policy decisions for the future based on the uncertain science of global warming      Oceans: A Very Short Introduction Dorrik Stow, 2018-01-25 The importance of the oceans to life on Earth

cannot be overstated Liquid water covers more than 70% of our planet's surface and in past geological time has spread over 85% Life on Earth began in the oceans over 3.5 billion years ago and remained there for the great majority of that time Today the seas still provide 99% of habitable living space the largest repository of biomass and holds the greatest number of undiscovered species on the planet Our oceans are vital for the regulation of climate and with global warming and decreasing land area they have become increasingly important as the source of food energy in the form of oil and gas and for their mineral wealth Oceans also form a key part of the biogeochemical cycles of carbon nitrogen and other elements critical to life Nutrients in upwelling areas are spread by ocean currents and the plankton of the seas supports a wealth of wildlife In this Very Short Introduction Dorrik Stow analyses these most important components of our blue planet and considers their relationship with and exploitation by humans He shows how the oceans are an essential resource to our overpopulated world and discusses why exploration and greater scientific understanding of the oceans their chemistry and their mineral wealth are now a high priority Stow also explores what we know of how oceans originate and evolve and change the shape of the seafloor and nature of its cover the physical processes that stir the waters and mix such a rich chemical broth and the inseparable link between oceans and climate As polar ice melts and sea levels rise countless millions who have made their homes on low lying lands close to the sea are threatened As scientific exploration of the seas gathers pace the new knowledge gained of the ocean Earth systems and their interaction with the human environment is vital to our understanding of how we can preserve these ultimately fragile environments

**Exercises**

**in Environmental Physics** Valerio Faraoni, 2007-01-15 The study of environmental physics requires understanding topics from many different areas of physics as well as comprehension of physical aspects of the world around us. Several excellent textbooks are available covering most aspects of environmental physics and of applications of physics to the natural environment from various points of view. However, while teaching environmental physics to university students, I sorely missed a book specifically devoted to exercises for the environmental science student. Thus the motivation for this book came about as in physics as well as in many other disciplines, satisfactory knowledge of a subject cannot be acquired without practice. Usually students are not familiar with the various areas of physics that are required to describe both the environment and the human impact upon it. At the same time, students need to develop skills in the manipulation of the ideas and concepts learned in class. Therefore, this exercise book is addressed to all levels of university students in environmental sciences. Because of the wide range of potential users, this book contains both calculus-based and algebra-based problems ranging from very simple to advanced ones. Multiple solutions at different levels are presented for certain problems; the student who is just beginning to learn calculus will benefit from the comparison of the different methods of solution. The material is also useful for courses in atmospheric physics, environmental aspects of energy generation and transport, groundwater hydrology, soil physics, and ocean physics, and selected parts may even be used for basic undergraduate physics courses. This collection of exercises is based on courses taught at the University of Northern British Columbia and at the University of Victoria, Canada.
