Evolution And Environment:

Evolution and Environment in Tropical America Jeremy B. C. Jackson, Ann F. Budd, Anthony G. Coates, 1996-12-15
How were the tropical Americas formed This ambitious volume draws on extensive multidisciplinary research to develop new views of the geological formation of the isthmus linking North and South America and of the major environmental changes that reshaped the Neotropics to create its present day marine and terrestrial ecosystems Recent discoveries show that dramatic changes in climate and ocean circulation can occur very quickly and that ecological communities respond just as rapidly Abrupt changes in the composition of fossil assemblages formerly dismissed as artifacts of a poor fossil record now are seen as accurate records of swift changes in the composition of ocean communities The twenty four contributors use current work in paleontology geology oceanography anthropology ecology and evolution to paint this challenging portrait of rapid environmental and evolutionary change Their conclusions argue for a revision of existing interpretations of the fossil record and the processes including invading Eurasian peoples that have produced it Evolution and environment

Theodosius Grigorievich Dobzhansky, 1960 *Environmental Evolution* Lynn Margulis, Clifford Matthews, Aaron Haselton, 2000 Fifteen distinguished scientists discuss the effects of life past and present on planet Earth **Evolution in Changing Environments** Richard Levins, 1968-08-21 Professor Levins one of the leading explorers in the field of integrated population biology considers the mutual interpenetration and joint evolution of organism and environment occurring on several levels at once Physiological and behavioral adaptations to short term fluctuations of the environment condition the responses of populations to long term changes and geographic gradients These in turn affect the way species divide the environments among themselves in communities and therefore the numbers of species which can coexist Environment is treated here abstractly as pattern patchiness variability range etc Populations are studied in their patterns local heterogeneity geographic variability faunistic diversity etc **Evolution on Planet Earth** Lynn Rothschild, Adrian Lister, 2003-06-19 Driving evolution forward the Earth's physical environment has challenged the very survival of organisms and ecosystems throughout the ages With a fresh new perspective Evolution on Planet Earth shows how these physical realities and hurdles shaped the primary phases of life on the planet The book's thorough coverage also includes chapters on more proximate factors and paleoenvironmental events that influenced the diversity of life A team of notable ecologists evolutionary biologists and paleontologists join forces to describe drifting continents extinction events and climate change important topics that continue to shape Earth's inhabitants to this very day In a world where global change has become an international issue this book provides a several billion year evolutionary perspective on what the environment and environmental change means to life Provides thorough background information on each topic while introducing cutting edge research Features original material solicited from the leading minds in evolutionary biology and geology today Emphasizes the influence of massive geological forces continental drift volcanic activity sea and tides Life Strategies, Human

Evolution, Environmental Design V. Geist, 2013-11-11 Consider that you were asked how to ensure human survival Where would you begin Conservation of resources jumps to mind We need to conserve resources in order that economic activities may continue Alas this is a false start Resources are always defined by a given economic system and only it determines what is and what is not a resource Therefore conserving resources implies only the perpetuation of the appropriate economic system Conservation of resources as we know them has nothing to do with the survival of mankind but it has very much to do with the survival of the industrial system and society we live in today We have to start therefore at a more basic level This level some may argue is addressed by ensuring for human beings clean genes Again this is a mistaken beginning It is thoroughly mistaken for reasons of science It is a false start because malfunctioning organs and morphological structures are not only due to deleterious hereditary factors but particularly due to unfavorable environments during early growth and development Moreover eugenics is not acceptable to any but a small fraction of society Eugenics may not be irrelevant to our future but is premature and should be of little concern until we understand how human genes and environment interact

The Dominant Animal Paul R. Ehrlich, Anne H. Ehrlich, 2008-06-30 In humanity's more than 100 000 year history we have evolved from vulnerable creatures clawing sustenance from Earth to a sophisticated global society manipulating every inch of it In short we have become the dominant animal Why then are we creating a world that threatens our own species What can we do to change the current trajectory toward more climate change increased famine and epidemic disease Renowned Stanford scientists Paul R Ehrlich and Anne H Ehrlich believe that intelligently addressing those questions depends on a clear understanding of how we evolved and how and why we're changing the planet in ways that darken our descendants future The Dominant Animal arms readers with that knowledge tracing the interplay between environmental change and genetic and cultural evolution since the dawn of humanity In lucid and engaging prose they describe how Homo sapiens adapted to their surroundings eventually developing the vibrant cultures vast scientific knowledge and technological wizardry we know today But the Ehrlichs also explore the flip side of this triumphant story of innovation and conquest As we clear forests to raise crops and build cities lace the continents with highways and create chemicals never before seen in nature we may be undermining our own supremacy The threats of environmental damage are clear from the daily headlines but the outcome is far from destined Humanity can again adapt if we learn from our evolutionary past Those lessons are crystallized in The Dominant Animal Tackling the fundamental challenge of the human predicament Paul and Anne Ehrlich offer a vivid and unique exploration of our origins our evolution and our future *Adaptation and Environment* Robert N. Brandon, 2014-07-14 By focusing on the crucial role of environment in the process of adaptation Robert Brandon clarifies definitions and principles so as to help make the argument of evolution by natural selection empirically testable He proposes that natural selection is the process of differential reproduction resulting from differential adaptedness to a common selective environment Originally published in 1990 The Princeton Legacy Library uses the latest print on demand technology

to again make available previously out of print books from the distinguished backlist of Princeton University Press These editions preserve the original texts of these important books while presenting them in durable paperback and hardcover editions The goal of the Princeton Legacy Library is to vastly increase access to the rich scholarly heritage found in the thousands of books published by Princeton University Press since its founding in 1905

Big Questions in Ecology and Evolution Thomas N. Sherratt, David M. Wilkinson, 2009-02-20 Why do we age Why cooperate Why do so many species engage in sex Why do the tropics have so many species When did humans start to affect world climate This book provides an introduction to a range of fundamental questions that have taxed evolutionary biologists and ecologists for decades Some of the phenomena discussed are on first reflection simply puzzling to understand from an evolutionary perspective whilst others have direct implications for the future of the planet All of the questions posed have at least a partial solution all have seen exciting breakthroughs in recent years yet many of the explanations continue to be hotly debated Big Questions in Ecology and Evolution is a curiosity driven book written in an accessible way so as to appeal to a broad audience It is very deliberately not a formal text book but something designed to transmit the excitement and breadth of the field by discussing a number of major questions in ecology and evolution and how they have been answered This is a book aimed at informing and inspiring anybody with an interest in ecology and evolution It reveals to the reader the immense scope of the field its fundamental importance and the exciting breakthroughs that have been made in recent years

Organism and Environment Sonia E. Sultan, 2015 Over the past decade advances in both molecular developmental biology and evolutionary ecology have made possible a new understanding of organisms as dynamic systems interacting with their environments This innovative book synthesizes a wealth of recent research findings to examine how environments influence phenotypic expression in individual organisms ecological development or eco devo and how organisms in turn alter their environments niche construction A key argument explored throughout the book is that ecological interactions as well as natural selection are shaped by these dual organism environment effects This synthesis is particularly timely as biologists seek a unified contemporary framework in which to investigate the developmental outcomes ecological success and evolutionary prospects of organisms in rapidly changing environments Organism and Environment is an advanced text suitable for graduate level students taking seminar courses in ecology evolution and developmental biology as well as academics and researchers in these fields

The Evolution of American Ecology, 1890-2000 Sharon E. Kingsland, 2005 In the 1890s several initiatives in American botany converged The creation of new institutions such as the New York Botanical Garden coincided with radical reforms in taxonomic practice and the emergence of an experimental program of research on evolutionary problems Sharon Kingsland explores how these changes gave

impetus to the new field of ecology that was defined at exactly this time She argues that the creation of institutions and research laboratories coupled with new intellectual directions in science were crucial to the development of ecology as a discipline in the United States The main concern of ecology the relationship between organisms and environment was central to scientific studies aimed at understanding and controlling the evolutionary process Kingsland considers the evolutionary context in which ecology arose especially neo Lamarckian ideas and the new mutation theory and explores the relationship between scientific research and broader theories about social progress and the evolution of human civilization By midcentury American ecologists were leading the rapid development of ecosystem ecology and society in the postwar context foreshadowing the environmental critiques of the 1960s As the ecosystem concept evolved so too did debates about how human ecology should be incorporated into the biological sciences Kingsland concludes with an examination of ecology in the modern urban environment reflecting on how scientists are now being challenged to produce innovative responses to pressing problems The Evolution of American Ecology 1890 2000 offers an innovative study not only of the scientific landscape in turn of the century America but of current questions in ecological science **Life Strategies, Human**

Boughey, 1971 **Evolutionary History** Edmund

Russell, 2011-04-11 We tend to see history and evolution springing from separate roots one grounded in the human world and the other in the natural world Human beings have however become probably the most powerful species shaping evolution today and human caused evolution in other species has probably been the most important force shaping human history This book introduces readers to evolutionary history a new field that unites history and biology to create a fuller understanding of the past than either can produce on its own Evolutionary history can stimulate surprising new hypotheses for any field of history and evolutionary biology How many art historians would have guessed that sculpture encouraged the evolution of

tuskless elephants How many biologists would have predicted that human poverty would accelerate animal evolution How many military historians would have suspected that plant evolution would convert a counter insurgency strategy into a rebel subsidy With examples from around the globe this book will help readers see the broadest patterns of history and the details of their own life in a new light **Extreme Environmental Change and Evolution** Ary A. Hoffmann, Peter A.

Parsons, 1997-07-10 Most natural populations experience extremely stressful conditions This book discusses how such conditions can cause periods of intense selection that increase both phenotypic and genetic variation and allow organisms with novel characteristics to be first generated and then established in the population Using evidence from the fossil record the authors argue that stressful conditions can have a major impact on the environments They also suggest that as a consequence periods of stress must be taken into consideration when long term conservation strategies are planned particularly as stressful conditions emerge as a result of human activities This broad overview will be of great interest to students and researchers in the field of evolutionary biology genetics ecology paleontology and conservation biology

Evolutionary Conservation Biology Régis Ferrière, Ulf Dieckmann, Denis Couvet, 2004-06-10 As anthropogenic environmental changes spread and intensify across the planet conservation biologists have to analyze dynamics at large spatial and temporal scales Ecological and evolutionary processes are then closely intertwined In particular evolutionary responses to anthropogenic environmental change can be so fast and pronounced that conservation biology can no longer afford to ignore them To tackle this challenge areas of conservation biology that are disparate ought to be integrated into a unified framework Bringing together conservation genetics demography and ecology this book introduces evolutionary conservation biology as an integrative approach to managing species in conjunction with ecological interactions and evolutionary processes Which characteristics of species and which features of environmental change foster or hinder evolutionary responses in ecological systems How do such responses affect population viability community dynamics and ecosystem functioning Under which conditions will evolutionary responses ameliorate rather than worsen the impact of environmental change **(R)Evolution** Rob Dekkers, 2005-07-06 R Evolution studies the adaptation of industrial

organisations to the dynamics of the environment by drawing an analogy with evolutionary biology by extensively studying literature in management science and by case studies These investigations have led to the insight that companies might evolve slower than generally expected they doubt the effect of reorganizations as commonly practiced in industry Additionally this work proposes the model for the Innovation Impact Point the model for the Dynamic Adaptation Capability the model for Collaboration **Evolution, Animal 'rights' & the Environment** James B. Reichmann, 2000 The author of this study undertakes an investigation of the metaethical grounds of rights theory with special focus on the controversial issue of whether creatures other than humans can and should be considered true subjects of rights He contends that before assigning rights to this or that individual or group whether human or not we need to be very clear about what it is we are

assigning to whom and why The book argues that the efforts to build a case supporting animal and environmental rights fail in their quest and that any such effort resting on a Darwinian evolutionary base is likewise condemned to fail The author investigates life phenomena followed by a detailed comparative study of knowing communicating and doing as these are observed in the human and nonhuman animal This is followed by an overview of diverse views advanced by contemporary environmental ethicists and animal rights advocates including Peter Singer Tom Regan J Baird Callicott Laura Westra and Don E Marietta Jr Conclusions drawn from this study include the claims that classic Darwinian theory provides no admissible premise from which to derive a theory of inherent inalienable rights no satisfactory explanation of the origin of rights and obligation can derive save from within the context of natural law theory the human person alone unqualifiedly possesses rights and the view that vegetarianism is an ethical mandate is neither compatible with the Christian world view nor philosophically sound
