*Complex Networks* Ivan Zelinka, Guanrong Chen, 2017-11-25 Evolutionary algorithms constitute a class of well known algorithms which are designed based on the Darwinian theory of evolution and Mendelian theory of heritage They are partly based on random and partly based on deterministic principles Due to this nature it is challenging to predict and control its performance in solving complex nonlinear problems Recently the study of evolutionary dynamics is focused not only on the traditional investigations but also on the understanding and analyzing new principles with the intention of controlling and utilizing their properties and performances toward more effective real world applications In this book based on many years of intensive research of the authors is proposing novel ideas about advancing evolutionary dynamics towards new phenomena including many new topics even the dynamics of equivalent social networks In fact it includes more advanced complex networks and incorporates them with the CMLs coupled map lattices which are usually used for spatiotemporal complex systems simulation and analysis based on the observation that chaos in CML can be controlled so does evolution dynamics All the chapter authors are to the best of our knowledge originators of the ideas mentioned above and researchers on evolutionary algorithms and chaotic dynamics as well as complex networks who will provide benefits to the readers regarding modern scientific research on related subjects     Constraint-Handling in Evolutionary Optimization Efrén

Mezura-Montes, 2009-04-07 This book is the result of a special session on constraint handling techniques used in evolutionary algorithms within the Congress on Evolutionary Computation CEC in 2007 It presents recent research in constraint handling in evolutionary optimization     **Evolutionary Optimization** Ruhul Sarker, Masoud Mohammadian, Xin Yao, 2002-01-31 The

use of evolutionary computation techniques has grown considerably over the past several years Over this time the use and applications of these techniques have been further enhanced resulting in a set of computational intelligence also known as modern heuristics tools that are particularly adept for solving complex optimization problems Moreover they are characteristically more robust than traditional methods based on formal logics or mathematical programming for many real world OR MS problems Hence evolutionary computation techniques have dealt with complex optimization problems better than traditional optimization techniques although they can be applied to easy and simple problems where conventional techniques work well Clearly there is a need for a volume that both reviews state of the art evolutionary computation techniques and surveys the most recent developments in their use for solving complex OR MS problems This volume on Evolutionary Optimization seeks to fill this need Evolutionary Optimization is a volume of invited papers written by leading researchers in the field All papers were peer reviewed by at least two recognized reviewers The book covers the foundation as well as the practical side of evolutionary optimization     **Evolution, Complexity and Artificial Life** Stefano

Cagnoni, Marco Mirolli, Marco Villani, 2013-12-21 Evolution and complexity characterize both biological and artificial life by direct modeling of biological processes and the creation of populations of interacting entities from which complex behaviors can emerge and evolve This edited book includes invited chapters from leading scientists in the fields of artificial life complex

systems and evolutionary computing The contributions identify both fundamental theoretical issues and state of the art real world applications The book is intended for researchers and graduate students in the related domains

**Evolutionary Computation for Modeling and Optimization** Daniel Ashlock, 2006-04-04 Evolutionary Computation for Optimization and Modeling is an introduction to evolutionary computation a field which includes genetic algorithms evolutionary programming evolution strategies and genetic programming The text is a survey of some application of evolutionary algorithms It introduces mutation crossover design issues of selection and replacement methods the issue of populations size and the question of design of the fitness function It also includes a methodological material on efficient implementation Some of the other topics in this book include the design of simple evolutionary algorithms applications to several types of optimization evolutionary robotics simple evolutionary neural computation and several types of automatic programming including genetic programming The book gives applications to biology and bioinformatics and introduces a number of tools that can be used in biological modeling including evolutionary game theory Advanced techniques such as cellular encoding grammar based encoding and graph based evolutionary algorithms are also covered This book presents a large number of homework problems projects and experiments with a goal of illustrating single aspects of evolutionary computation and comparing different methods Its readership is intended for an undergraduate or first year graduate course in evolutionary computation for computer science engineering or other computational science students Engineering computer science and applied math students will find this book a useful guide to using evolutionary algorithms as a problem solving tool

**Semigroup Methods for Evolution Equations on Networks** Delio Mugnolo, 2014-05-21 This concise text is based on a series of lectures held only a few years ago and originally intended as an introduction to known results on linear hyperbolic and parabolic equations Yet the topic of differential equations on graphs ramified spaces and more general network like objects has recently gained significant momentum and well beyond the confines of mathematics there is a lively interdisciplinary discourse on all aspects of so called complex networks Such network like structures can be found in virtually all branches of science engineering and the humanities and future research thus calls for solid theoretical foundations This book is specifically devoted to the study of evolution equations i e of time dependent differential equations such as the heat equation the wave equation or the Schrödinger equation quantum graphs bearing in mind that the majority of the literature in the last ten years on the subject of differential equations of graphs has been devoted to elliptic equations and related spectral problems Moreover for tackling the most general settings e g encoded in the transmission conditions in the network nodes one classical and elegant tool is that of operator semigroups This book is simultaneously a very concise introduction to this theory and a handbook on its applications to differential equations on networks With a more interdisciplinary readership in mind full proofs of mathematical statements have been frequently omitted in favor of keeping the text as concise fluid and self contained as possible In addition a brief chapter devoted to the field of neurodynamics of the brain cortex provides a

concrete link to ongoing applied research      Introduction to Evolutionary Algorithms Xinjie Yu, Mitsuo Gen, 2010-06-10 Evolutionary algorithms are becoming increasingly attractive across various disciplines such as operations research computer science industrial engineering electrical engineering social science and economics Introduction to Evolutionary Algorithms presents an insightful comprehensive and up to date treatment of evolutionary algorithms It covers such hot topics as genetic algorithms differential evolution swarm intelligence and artificial immune systems The reader is introduced to a range of applications as Introduction to Evolutionary Algorithms demonstrates how to model real world problems how to encode and decode individuals and how to design effective search operators according to the chromosome structures with examples of constraint optimization multiobjective optimization combinatorial optimization and supervised unsupervised learning This emphasis on practical applications will benefit all students whether they choose to continue their academic career or to enter a particular industry Introduction to Evolutionary Algorithms is intended as a textbook or self study material for both advanced undergraduates and graduate students Additional features such as recommended further reading and ideas for research projects combine to form an accessible and interesting pedagogical approach to this widely used discipline      *Biological Computation* Ehud Lamm, Ron Unger, 2011-05-25 The area of biologically inspired computing or biological computation involves the development of new biologically based techniques for solving difficult computational problems A unified overview of computer science ideas inspired by biology Biological Computation presents the most fundamental and significant concepts in this area In the book students discover that bacteria communicate that DNA can be used for performing computations how evolution solves optimization problems that the way ants organize their nests can be applied to solve clustering problems and what the human immune system can teach us about protecting computer networks The authors discuss more biological examples such as these along with the computational techniques developed from these scenarios The text focuses on cellular automata evolutionary computation neural networks and molecular computation Each chapter explores the biological background describes the computational techniques gives examples of applications discusses possible variants of the techniques and includes exercises and solutions The authors use the examples and exercises to illustrate key ideas and techniques Clearly conveying the essence of the major computational approaches in the field this book brings students to the point where they can either produce a working implementation of the techniques or effectively use one of the many available implementations Moreover the techniques discussed reflect fundamental principles that can be applied beyond bio inspired computing Supplementary material is available on Dr Unger's website      **Evolutionary Learning: Advances in Theories and Algorithms** Zhi-Hua Zhou, Yang Yu, Chao Qian, 2019-05-22 Many machine learning tasks involve solving complex optimization problems such as working on non differentiable non continuous and non unique objective functions in some cases it can prove difficult to even define an explicit objective function Evolutionary learning applies evolutionary algorithms to address optimization problems in machine learning and has yielded encouraging outcomes

in many applications. However, due to the heuristic nature of evolutionary optimization, most outcomes to date have been empirical and lack theoretical support. This shortcoming has kept evolutionary learning from being well received in the machine learning community, which favors solid theoretical approaches. Recently, there have been considerable efforts to address this issue. This book presents a range of those efforts, divided into four parts. Part I briefly introduces readers to evolutionary learning and provides some preliminaries, while Part II presents general theoretical tools for the analysis of running time and approximation performance in evolutionary algorithms. Based on these general tools, Part III presents a number of theoretical findings on major factors in evolutionary optimization, such as recombination, representation, inaccurate fitness evaluation, and population. In closing, Part IV addresses the development of evolutionary learning algorithms with provable theoretical guarantees for several representative tasks in which evolutionary learning offers excellent performance.
