Abstract

Cycads represent an example of the success of evolutionary stasis. Despite their early origin, they survived multiple events of mass extinction and diversified in modern tropical ecosystems during the Cenozoic without major changes in their morphology. What factors have allowed their persistence and diversification despite their conservative nature? We reviewed documentation on the micro- and macro-evolutionary processes involved in the diversification of the Neotropical genus *Dioon*. *Dioon* comprises 18 species from varied habitats in Mexico and Honduras, and serves as a model to understand the patterns of cycad diversification. Here, we synthesize evidence reached from different fields, especially biogeography, phylogenetics, population ecology, and speciation, to propose a mechanism that can explain the current patterns of biodiversity in *Dioon*. At the macroevolutionary scale, a Paleogene origin for *Dioon* is more likely than an alternative hypothesis of a Neogene origin. *Dioon* lineages have dispersed along with the expansion of tropical forests throughout main mountain chains. Subsequently, climate change, and particularly aridification, promoted the fragmentation of the tropical forests, allowing the main *Dioon* clades to evolve in isolation at distinct biogeographic regimes. At the microevolutionary scale, low seed dispersal capability, stochastic demographic processes, and niche conservatism restrict the lineages to isolate themselves at narrow habitats, promoting local adaptation in populations. Local adaptation seems to be a process achieved through many generations under stabilizing selection. Altogether, these processes shaped the diversification in *Dioon*. This review attempts to stimulate further research on cycads and other biological groups that have diversified despite their apparent evolutionary stasis.

Evolutionary Trends in Flowering Plants Armen Leonovich Takhtadzhian, 1991 Takhtajan one of the foremost authorities on flowering plant evolution has brought together from the literature and his own studies interpretations of the origin and evolution of various vegetative and reproductive parts of flowering plants Starting with growth habit he continues through leaf and stem structure including the origin of vessels sieve tubes and rays to flowers After tracing the possible origin of the flower he discusses in detail the sepals petals stamens and carpels accounting for their variations in number of parts fusion position and structure The evolution and origin of the micro and megagametophytes and the development of triple fusion are considered The book ends with the developmental sequence of the fruit and seed types Each chapter has its own extensive bibliography Takhtajan has produced a book that will be essential in the library of any college where plant evolution is considered C T Mason Jr University of Arizona Choice Reviews [Origin and Evolution of Caribbean Mangroves](#) Valenti Rull, 2024-05-22 This book provides a comprehensive detailed and coherent spatio temporal account of Caribbean mangrove evolution from its evolutionary origins to the present that is not available for any mangrove region in the world Mangroves are intertidal wetland forests that play a crucial role in the maintenance of terrestrial and marine biodiversity and in the functioning of global biogeochemical cycles especially the carbon cycle These ecosystems dominate the tropical subtropical coasts of all continents and are among the most threatened ecosystems in the world This book combines all temporal scales from the geological to the ecological to provide an integrated picture of mangrove history and the natural and anthropogenic drivers of ecological and evolutionary change This may be useful not only for understanding the current ecological status of these emblematic ecosystems but also for informing their conservation in the face of ongoing global change

The Behavior, Ecology and Evolution of Cichlid Fishes Maria E. Abate, David L.G. Noakes, 2021-09-19 This volume constitutes the most recent and most comprehensive consideration of the largest family of bony fishes the Cichlidae This book offers an integrated perspective of cichlid fishes ranging from conservation of threatened species to management of cichlids as invasive species themselves Long standing models of taxonomy and systematics are subjected to the most recent applications and interpretations of molecular evidence and multivariate analyses and cichlid adaptive radiations at different scales are elucidated The incredible diversity of endemic cichlid species in African lakes is revisited as possible examples of sympatric speciation and as serious cases for management in complex anthropogenic environments Extreme hydrology and bathymetry as driver of micro allopatric speciation is explored in the African riverine hotspot of diversity of the lower Congo River Dramatic new molecular evidence draws attention to the complex taxonomy and systematics of Neotropical cichlids including the crater lakes of Central America Molecular genetics genomics imaging tools and field study techniques assess the roles of natural sexual and kin selection in shaping cichlid traits and beyond The complex behavioral adaptations of cichlids are considered from a number of sub disciplines including sensory biology neurobiology development
