Human Factors in Auditory Warnings Judy Edworthy, Neville A. Stanton, 2019-01-15 First published in 1999, this book provides answers to many of the problems associated with the design and application of auditory warnings. It represents the position of contemporary auditory warnings research and development in a single, unique volume. Application domains include air traffic control, aviation emergency services, manufacturing, medicine, military, and nuclear power. The contributors constitute many key experts in this area, some of whom are psychoacousticians, some psychologists, and some ergonomists. Correspondingly, the chapters range from those covering basic topics such as audibility and localization of warnings through psychological issues concerned with the relationship between design, understanding, and the behavioural response to the more general ergonomic issues of implementing the warnings in a particular context. Although each of the chapters takes a slightly different perspective, they all balance theoretical underpinning with practical application. The editors have undertaken to draw all of the contributions together by providing an overview of warnings research at the beginning of the book and a summary of the contributions at the end. This book will appeal to all involved in the research, development, design, and implementation of auditory warnings.

The book also demonstrates how automata underlie several computer science engineering techniques. This monograph is a useful reference for scientists working in the areas of theoretical computer science, computational mathematics, computational linguistics, and compiler writing. It may also be used as a required text in classes dealing with the theory and applications of automata and theory of computation at the graduate level.
