**Respiratory System** Stephen T. Holgate, 1995-10-18 Immunopharmacology represents the boundary between the immune system and chemical mediators of the inflammatory and neuroendocrine responses The subject as applied to the respiratory system embraces most of the common non malignant lung diseases of which asthma and allied disorders are the most prevalent An understanding of the underlying mechanisms of the disorders provides rationale for prevention and drug treatment as well as creating opportunities for novel drug development Immunopharmacology of Respiratory System embraces all of these principles and should enable the reader to become rapidly updated in an area of medical importance

Focuses on aspects of disease pathogenesis that are common to a variety of lung disorders Includes coverage of the mechanisms of asthma origin progression and novel therapeutic interventions This volume is another in the Systems section of the Handbook of Immunopharmacology The Immunological Basis of Asthma Bart Lambrecht, Henk Hoogsteden, Zuzana Diamant, 2003-02-26 This text assesses the role of dendritic cells T and B lymphocytes epithelial and mast cells eosinophils neutrophils macrophages and their products in the initiation and progression of airway inflammation regulation and repair It unveils advances in immunology and cell biology to generate new therapeutic regimens for inflammatory and aller

T-Lymphocyte and Inflammatory Cell Research in Asthma G. Jolles, J. A. Karlsson, Jack H. Taylor, 2012-12-02 It is well established that asthma is an inflammatory disease of the airway mucosa and drugs like inhaled glucocorticoids are now commonly introduced early in therapy A characteristic feature of this disease is the vast number of eosinophils in airway tissue although many other migratory and resident inflammatory cells with the capacity to synthesize and release cytokines and putative asthma mediators are present in the inflamed mucosa The cross talk between lymphocytes and these cells and the role of cytokines in complex biological networks are currently areas of intense research This volume gathers together chapters and discussions on the biology of immunocompetent and inflammatory cells cellular interplay and communication and on the relative importance of cells and mediators in disease It should help contribute to further insights into the pathology of asthma and to the development of novel efficacious drugs for the treatment of asthma and related respiratory disorders **Annual Reports in Medicinal Chemistry**, 1999-09-08 Annual Reports in Medicinal Chemistry continues to strive to provide timely and critical reviews of important topics in medicinal chemistry together with an emphasis on emerging topics in the biological sciences which are expected to provide the basis for entirely new future therapies Volume 34 retains the familiar format of previous volumes this year with 33 chapters Sections I IV are disease oriented and generally report on specific medicinal agents with updates from Volume 33 on antithrombotics neurokinin receptor antagonists anticoagulants and new antibacterials As in past volumes annual updates have been limited to only the most active areas of research in favor of specifically focused and mechanistically oriented chapters where the objective is to provide the reader with the most important new results in a particular field Sections V and VI continue to emphasize important topics in medicinal chemistry biology and drug design as well as the critical interfaces among these disciplines This volume concludes with To Market To Market a chapter on NCE and NBE introductions worldwide in 1998 a chapter on pharmagenomics and finally one on malaria as a third world disease in need of a first world drug development **AIDS and Respiratory Medicine** Margaret A. Johnson, Robert Miller, Alimuddin Zumla, 2013-11-11 In the 15 years of the acquired immunodeficiency syndrome AIDS pandemic much has been learnt about its natural history and complications It is clear that the lung is a major target organ both for the human immunodeficiency virus HIV and a wide array of infectious and non infectious pulmonary complications A great deal of information on the epidemiology microbiology immunology clinical features diagnosis and

management of these pulmonary complications has accumulated during the past 15 years. Given the enormous explosion in information, it is now timely to bring together this knowledge in this 25 chapter volume on AIDS and respiratory medicine. The contributors to this volume are prominent epidemiologists, doctors, microbiologists, and scientists from Europe, USA, and Africa. Professors Chretien and Enarson give a masterful account of the epidemiology of lung complications of HIV. Drs. Zumla, Rowland Jones, and Professor McMichael give a detailed summary of the lung immune responses to HIV. They outline normal lung defenses and discuss the consequences of HIV infection on them. The pulmonary radiological features of HIV and its complications as seen in the USA and Europe are illustrated by Professors Armstrong and Dee, and this is compared and contrasted by Professor Tshibwabwa Tumba, who brings together his vast experience of chest X-rays in AIDS patients from Central Africa. Drs. O'Doherty and Miller deal with the uses and potential applications of nuclear medicine in imaging of the chest in AIDS patients.

Advances in Pharmacology, 1992-02-24  
*Advances in Pharmacology: Secretion of Cytokines and Chemokines by Innate Immune Cells* Paige Lacy, 2015-05-19

The release of cytokines, chemokines, and other immune modulating mediators released from innate immune cells including eosinophils, neutrophils, macrophages, dendritic cells, mast cells, and epithelial cells is an important event in immunity. Cytokine synthesis and transportation occurs through the canonical protein trafficking pathway associated with endoplasmic reticulum and Golgi. How cytokines are released upon their exit from the trans-Golgi network varies enormously between cell types, and in many cells, this has not yet been characterized. This issue delves into the plethora of cytokines released by innate immune cells and, where possible, shines light on specific mechanisms that regulate trafficking and release of Golgi-derived vesicles. Each cell type also shows varying degrees of dependency on microtubule organization and actin cytoskeleton remodeling for cytokine secretion. Understanding the mechanisms of cytokine secretion will reveal the inner workings of individual innate immune cell types and allow identification of critical regulatory steps in cytokine release.

Apoptosis and Inflammation James Winkler, 2012-12-06

Apoptosis is a form of cell death that occurs in a controlled manner and is generally noninflammatory in nature. Apoptosis, or programmed cell death, implies a cell death that is part of a normal physiological process of pruning of unneeded cells. However, many disease conditions utilize apoptosis for pathological ends, resulting in inappropriate cell death and tissue destruction. This book starts with an introduction that reviews the general characteristics of apoptosis, its regulation, and its role in physiology and disease. Next, the book focuses on three areas as they relate to inflammatory cells and diseases. The first area consists of chapters on signals for apoptosis important to inflammatory cells, namely growth factors and arachidonic acid metabolism. The next area that the book focuses on are effects at the cellular level on cell survival versus cell death and signals critical for cell function in both normal and disease states. These topics are covered in chapters on lymphocytes, granulocytes, chondrocytes, and keratinocytes. The last area that the book focuses on are events at the level of tissue and disease, looking at the evidence for altered apoptosis and/or apoptotic processes in immune and inflammatory diseases. These

topics are covered in chapters on rheumatoid arthritis osteoarthritis lupus psoriasis and renal disease Together these chapters will provide the reader with the latest insight in the role of apoptosis in inflammatory cells and diseases This book starts with an introduction that reviews the general characteristics of apoptosis its regulation and its role in physiology and disease Next the book focuses on three areas as they relate to inflammatory cells and diseases The first area consists of chapters on signals for apoptosis important to inflammatory cells namely growth factors and arachidonic acid metabolism The next area that the book focuses on are effects at the cellular level on cell survival versus cell death and signals critical for cell function in both normal and disease states These topics are covered in chapters on lymphocytes granulocytes chondrocytes and keratinocytes The last area that the book focuses on are events at the level of tissue and disease looking at the evidence for altered apoptosis and or apoptotic processes in immune and inflammatory diseases These topics are covered in chapters on rheumatoid arthritis osteoarthritis lupus psoriasis and renal disease Together these chapters will provide the reader with the latest insight in the role of apoptosis in inflammatory cells and diseases
