Epidemiological Practices In Research On Small Effects:

Epidemiological Practices in Research on Small Effects Hans Hoffmeister, Moyses Szklo, Michael Thamm, 2012-12-06
Epidemiology faces its limits the search for subtle links between diet lifestyle or environmental factors and disease is an unending source of fear but often yields little certainty Studies on weak associations or small effects often produce contradictory results which confuse the public In this book numerous contributions and illustrated examples show the effects of this problem and sets out how future research should be approached in order to minimize the problems thus producing clear results of significance

Introduction to Epidemiologic Research Methods in Public Health Practice Susan Bailey, Deepa Handu, 2013 Tailored for multiple purposes including learning about and being equipped to evaluate research studies conducting thesis dissertation capstone projects and publishing scientific results Epidemiologic Research Methods in Public Health Practice covers the full breadth of epidemiologic study designs and topics case case control and cohort studies

Epidemiological Methods in Life Course Research Andrew Pickles, Barbara Maughan, Michael Wadsworth, 2007-06-28 Life course epidemiology is concerned with the origins of risk resilience and the processes of ageing and how this information can be of value in a public health context particularly for preventive health care Its challenge is to discover develop and analyse sources of data that cover many years of life especially the early developmental period when it is thought some fundamental aspects of lifetime health begin It also analyses genetic propensity and environmental exposures The rapid development of life course epidemiology in parallel with new work on developmental biology and the biology of ageing has brought innovative and ingenious methods of data collection These require new methodological techniques for the design of observational and quasi experimental studies of life course pathways to adult health This book describes these developments together with arguments for improving the measurement of the social environment and its role in developing individual vulnerability or adaptation The development of bio bank large scale population studies for the investigation of genetic effects is discussed alongside the challenges this creates for the epidemiologist The changing design of studies increasing flow of longitudinal data management of data analytic challenges timing and both traditional and more recent methods of managing these features in the study of causality are discussed Life course epidemiology has an essential role in developing methods to evaluate precisely the impact of interacting developmental environmental and genetic effects knowledge of which is fundamental for the design of effective prevention strategies in public health as well as for the advancement of understanding in the broader spheres of health and medicine

array of specialised topics Includes in depth coverage of the statistical underpinnings of contemporary epidemiologic methods Provides concise definitions and introductions to numerous concepts found in the current literature Uses extensive cross references helping to facilitate further research and enabling the reader to locate definitions and related concepts In addition to featuring extensive articles in the areas of descriptive and analytic epidemiology the Encyclopedia also provides the reader with articles on case control design and offers substantial coverage of allied statistical methods Statistical Methods in Epidemiologic Research Ray M. Merrill, 2016 Covers all the core topics such as digital logic data representation machine level language general organization and much more *Research Methods in Occupational Epidemiology* Harvey Checkoway, Neil Pearce, Douglas J. Crawford-Brown, 1989-05-25 Occupational epidemiology has emerged as a distinct subdiscipline of epidemiology and occupational medicine addressing fundamental public health and scientific questions relating to the specification of exposure response relationships assessment of the adequacy of occupational exposure guidelines and extrapolation of hazardous effects to other settings This book reviews the wide range of principles and methods used in epidemiologic studies of working populations It describes the historical development of occupational epidemiology the approaches to characterizing workplace exposures and the methods for designing and implementing epidemiologic studies The relative strengths and limitations of different study designs are emphasized Also included are more advanced discussions of statistical analysis the estimation of doses to biological targets and applications of the data derived from occupational epidemiology studies to disease modeling and risk assessment The volume will serve both as a textbook in epidemiology and occupational medicine courses and as a practical handbook for the design implementation and interpretation of research in this field **The Practice of Consumer Exposure Assessment** Gerhard Heinemeyer, Matti Jantunen, Pertti Hakkinen, 2020-01-03 This book closes a current gap by providing the scientific basis for consumer exposure assessment in the context of regulatory risk assessment Risk is defined as the likelihood of an event occurring and the severity of its effects The margin between the dose that leads to toxic effects and the actual dose of a chemical is identified by estimating population exposure The objective of this book is to provide an introduction into the scientific principles of consumer exposure assessment and to describe the methods used to estimate doses of chemicals the statistics applied and computer tools needed This is presented through the backgrounds of the special fields in exposure analysis such as exposure via food and by the use of consumer products toys clothing and other items As a general concept human exposure is also understood to include exposure via the environment and from the work setting In this context the specific features of consumer exposure are pointed out and put into the context of regulation in particular food safety chemicals safety REACH and consumer product safety The book is structured into three parts The first part deals with the general concepts of consumer exposure as part of the overall risk analysis framework of risk characterization risk assessment and risk communication It describes the three basic features of exposure assessment i the exposure scenario ii the exposure model

and iii the exposure parameters addressing external and internal exposure Also the statistical presentation of data to characterize populations in connection with variability uncertainty and quality of information and the presentation of exposure evaluation results is described The second part deals with the specific issues of exposure assessment exposure via food consumption exposure from use of consumer products household products toys cosmetic products textiles pesticides and others This part also covers methods for acquisition of data for exposure estimations including the relevant information from regulations needed to perform an accurate exposure assessment The third part portrays a prospect for further needs in the development and improvement of consumer exposure assessment as well as international activities and descriptions of the work of institutions that are involved in exposure assessment on the regulatory and scientific level And conversely it creates the rationale for the exposure assessment details necessary to satisfy regulatory needs such as derivation of upper limits and risk management issues

Environmental epidemiology is the study of the environmental causes of disease in populations and how these risks vary in relation to intensity and duration of exposure and other factors like genetic susceptibility As such it is the basic science upon which governmental safety standards and compensation policies for environmental and occupational exposure are based Profusely illustrated with examples from the epidemiologic literature on ionizing radiation and air pollution this text provides a systematic treatment of the statistical challenges that arise in environmental health studies and the use epidemiologic data in formulating public policy at a level suitable for graduate students and epidemiologic researchers After a general overview of study design and statistical methods for epidemiology generally the book goes on to address the problems that are unique to environmental health studies special purpose designs like two phase case control studies and countermatching statistical methods for modeling exposure time response relationships longitudinal and time series studies spatial and ecologic methods exposure measurement error interactions and mechanistic models It also discusses studies aimed at evaluating the public health benefits of interventions to improve the environment the use of epidemiologic data to establish environmental safety standards and compensation policy and concludes with emerging problems in reproductive epidemiology natural and man made disasters like global warming and the global burden of environmentally caused disease No other book provides such a broad perspective on the methodological challenges in this field at a level accessible to both epidemiologists and statisticians
