### ABSTRACT

Epilepsy is commonly known as seizure-associated medical conditions either morbid or consorbid altogether. Although many different procedures were determined for diagnosing and treating epilepsy using various methods. It is still very difficult to diagnose the exact causative path for an epilepsy occurrence. Thus, understanding epilepsy with its classifications, different pathophysiology have helped researcher to target-selective drugs against epilepsy. Thus, this article defines epilepsy with different classes of anti-epileptic drugs describing their advantages and disadvantages of their applications.

## INTRODUCTION

As per ILAE (International League against Epilepsy), "Epilepsy is short-term event consists of distinct signs and symptoms involving idiosyncratic nerve activities in CNS causing abnormal behaviour and action." It is often identified by transitory tendency of brain causing once or repetitive seizures either involving psychological, neurobiological or social repercussions. Recently, ILAE stated a new definition of epilepsy for clinical use which can be considered if any of the following situations experienced by patients:

(a) Minimum occurring of two outrageous reflective seizures with 24 hours of interval.

(b) At least one unrequited seizure having chances of occurring comparably related seizures following to the two motiveless seizures in the subsequent 10 years.

(c) Diagnostically identification of symptoms of seizures<sup>[1]</sup>.

Helen E. Scharfman explains seizures and epilepsy are often considered same. Although there is difference between them. Epilepsy is stated as unexpected re-occurring seizure while seizure was elicited by different factors and they may not re-occur in patient. Epileptogenesis shows the gradual evolution of epilepsy in neuronal activity of brain.

In other words, various of activities which gradually evolves the conditions to generate seizures into normal brain activity. Thus, pool of neurons was supposed to be highly elevated leading to abnormal discharge of signals to generate seizures<sup>[2]</sup>. Alternatively, P. A. Dekker reported that seizures are caused by the excess amount of effusion from neurons in central nervous system. It is anticipated as instantaneous

**Epilepsy** Steven C Schachter,2011-09-01 The clinical management of patients with epilepsy and the associated medical literature are rapidly evolving Evidence based Management of Epilepsy differs from other epilepsy textbooks by focusing specifically on topics where the available evidence is sufficiently well developed to be synthesized into straightforward summaries of proven therapies When evidence is missing or there is doubt controversy or ambiguity the distinguished authors offer treatment recommendations based on practice guidelines or consensus statements that span the gaps in evidence while pointing to those areas where further research is needed The initial chapters cover critically important aspects of antiepileptic drugs AEDs and surgical treatment such as when to start and stop AEDs how to monitor their effectiveness special considerations in women who become pregnant and when to consider surgery to alleviate seizures The following chapters cover the therapy of seizures when they develop after traumatic brain injury or stroke and the treatment of concomitant depression and anxiety in patients with epilepsy The final chapters discuss emerging topics in epilepsy the treatment of the postictal state technologies to predict and detect seizures strategies for closing the treatment gap and sudden unexpected death in epilepsy The contributors are renowned experts in their fields who successfully and succinctly present state of the art reviews based on the medical evidence designed to help the clinician be as best informed as possible in the care of patients with epilepsy Epilepsy - Case Report Collection 2022 Fernando Cendes,2023-06-23

**MRI-Negative Epilepsy** Elson L. So,Philippe Ryvlin,2015-03-26 Drug resistant epilepsy with negative MRI is frequently seen in patients considered for epilepsy surgery however clinical evaluation and surgical treatment is very complex and challenging Advanced imaging techniques are needed to detect the location of the epileptogenic zone In most cases intracranial EEG recording is required to delineate the region of seizure onset this carries some risks of major complications Moreover the borders between the recorded seizure onset and the location of important brain functions are often indistinct in MRI negative epilepsy Overall the outcome of MRI negative surgery is less favorable than that of MRI positive surgery but it can significantly improve with optimal management Each chapter critically appraises the role and value of specific diagnostic and treatment techniques to address the challenges of MRI negative epilepsy surgery Authors critique evidence and share

their expertise on the diagnostic options and surgical approaches that make epilepsy surgery possible and worthwhile in patients with this condition      *The Paroxysmal Disorders* Bettina Schmitz, Barbara Tettenborn, Donald L.
