Berliner, Jacques Reuben, 1978 Annotation Describes techniques and applications that have emerged since the previous volume in the series on spin labeling in 1989 and marks a shift in the series to topic focused volumes Among the topics are the analysis of spin label line shapes with novel inhomogeneous broadening from different components widths and applications to spatially disconnected domains in membranes a comparison of spin label spectra at X band and W band the site directed spin labeling of membrane proteins and of interactions between peptides and membranes spin labeled nucleic acids and electron paramagnetic resonance studies of living animals and related model systems Annotation copyrighted by Book News Inc Portland OR

Computational and Instrumental Methods in EPR Christopher J. Bender, Lawrence Berliner, 2006 Electron magnetic resonance in the time domain has been greatly facilitated by the introduction of novel resonance structures and better computational tools such as the increasingly widespread use of density matrix formalism This second volume in our series devoted both to instrumentation and computation addresses applications and advances in the analysis of spin relaxation time measurements Chapter 1 deals with the important problem of measuring spin relaxation times over a broad temporal range The author Dr Sushil Misra has worked on a wide variety of solutions to problems in this area with respect to both experimental and theoretical aspects and Chapter 1 summarizes much of his recent work which was enhanced by a fruitful collaboration with the late Professor Jacques Pescia Chapter 2 presents solutions to the problem of measuring short spin relaxation times Again in collaboration and tribute to the late Jacques Pescia's laboratory part of the chapter represents a translation of the amplitude modulation

technique section from a doctoral thesis by Robert Lopez in 1993 to The Paul Sabatier University Experimental data that appeared in the original thesis are placed at the end of subsections that correspond to the described technique Chapter 3 takes up the problem of multi frequency ENDOR and ESEEM and illustrates how small stepwise increments of spectrometer operating parameters can enable one to better determine spin Hamiltonian parameters via a graphical analysis

**Techniques for the Analysis of Membrane Proteins** C. Ragan, 2012-12-06 A preface should justify the existence of the book it precedes and this is invariably done in scientific texts by reference to the explosive growth

of the field since the last such volume appeared In molecular biology most fields can be justifiably described as growing explosively as should be the case for a young and vigorous science but the study of membrane proteins stands out as one which has taken giant strides in the last few years Ignorance of the structure and function of membrane proteins at the molecular level was certainly not due to lack of interest but rather was a result of lack of appropriate techniques It has above all been the development of new experimental methods which has wrenched membrane biochemistry out of what Anthony Martonosi fetchingly called its romantic phase Le lots of ideas and few facts into an era when the determination of membrane protein structure and mechanism is a reasonable goal Membrane proteins are generally classified as peripheral or integral Peripheral proteins are relatively easily dissociated from membranes by mild treatments whence their study is essentially no different to that of soluble proteins This book therefore concentrates on integral proteins which are strongly bound to the membrane by hydrophobic interactions with lipids A crucial step in their study is of necessity the development of methods of solubilization and purification under non denaturing conditions
