Functional Analysis and Related Topics, 1991 Hikosaburo Komatsu, 2006-11-15 In these proceedings of the international conference held in Kyoto in memory of the late Professor K

saku Yosida twenty six invited speakers display in their many facets of functional analysis and its applications in the research tradition of Yosida's school. Many of the topics are related to linear and non-linear partial differential equations including the Schrödinger equations, the Navier-Stokes equations and quasilinear hyperbolic equations. Several of the papers are survey articles, the others are original unpublished and refereed research articles. Also included is a full listing of the publications of K. Yosida. Recommended to students and research workers looking for a bird's eye view of current research activity in functional analysis and its applications.

Fixed Point Theory And Applications - Proceedings Of The Second International Conference Kok Keong Tan, 1992-08-08 This volume contains current works of researchers from twelve different countries on fixed point theory and applications. Topics include in part nonexpansive mappings, multifunctions, minimax inequalities, applications to game theory and computation of fixed points. It is valuable to pure and applied mathematicians as well as computing scientists and mathematical economists.

Quasi-Stationary Phenomena in Nonlinearly Perturbed Stochastic Systems Mats Gyllenberg, Dmitrii S. Silvestrov, 2008-10-31 The book is devoted to studies of quasi-stationary phenomena in nonlinearly perturbed stochastic systems. New methods of asymptotic analysis for nonlinearly perturbed stochastic processes based on new types of asymptotic expansions for perturbed renewal equation and recurrence algorithms for construction of asymptotic expansions for Markov type processes with absorption are presented. Asymptotic expansions are given in mixed ergodic for processes and large deviation theorems for absorption times for nonlinearly perturbed regenerative processes, semi-Markov processes and Markov chains. Applications to analysis of quasi-stationary phenomena in nonlinearly perturbed queueing systems, population dynamics and epidemic models and for risk processes are presented. The book also contains an extended bibliography of works in the area. It is an essential reference for theoretical and applied researchers in the field of stochastic processes and their applications and may be also useful for doctoral and advanced undergraduate students.

Diffusion Processes and Related Problems in Analysis, Volume II V. Wihstutz, M.A. Pinsky, 2012-12-06 During the weekend of March 16-18, 1990, the University of North Carolina at Charlotte hosted a conference on the subject of stochastic flows as part of a Special Activity Month in the Department of Mathematics. This conference was supported jointly by a National

Science Foundation grant and by the University of North Carolina at Charlotte Originally conceived as a regional conference for researchers in the Southeastern United States the conference eventually drew participation from both coasts of the U S and from abroad This broad based participation reflects a growing interest in the viewpoint of stochastic flows particularly in probability theory and more generally in mathematics as a whole While the theory of deterministic flows can be considered classical the stochastic counterpart has only been developed in the past decade through the efforts of Harris Kunita Elworthy Baxendale and others Much of this work was done in close connection with the theory of diffusion processes where dynamical systems implicitly enter probability theory by means of stochastic differential equations In this regard the Charlotte conference served as a natural outgrowth of the Conference on Diffusion Processes held at Northwestern University Evanston Illinois in October 1989 the proceedings of which has now been published as Volume I of the current series Due to this natural flow of ideas and with the assistance and support of the Editorial Board it was decided to organize the present two volume effort

Mathematics of Complexity and Dynamical Systems Robert A. Meyers, 2011-10-05
Mathematics of Complexity and Dynamical Systems is an authoritative reference to the basic tools and concepts of complexity systems theory and dynamical systems from the perspective of pure and applied mathematics Complex systems are systems that comprise many interacting parts with the ability to generate a new quality of collective behavior through self organization e g the spontaneous formation of temporal spatial or functional structures These systems are often characterized by extreme sensitivity to initial conditions as well as emergent behavior that are not readily predictable or even completely deterministic The more than 100 entries in this wide ranging single source work provide a comprehensive explication of the theory and applications of mathematical complexity covering ergodic theory fractals and multifractals dynamical systems perturbation theory solitons systems and control theory and related topics Mathematics of Complexity and Dynamical Systems is an essential reference for all those interested in mathematical complexity from undergraduate and

Probability Measures on Semigroups: Convolution Products, Random Walks and Random Matrices Göran Högnäs, Arunava Mukherjea, 2013-03-09 A Scientific American article on chaos see Crutchfield et al 1986 illustrates a very persuasive example of recurrence A painting of Henri Poincaré or rather a digitized version of it is stretched and cut to produce a mildly distorted image of Poincaré The same procedure is applied to the distorted image and the process is repeated over and over again on the successively more and more blurred images After a dozen repetitions nothing seems to be left of the original portrait Miraculously structured images appear briefly as we continue to apply the

distortion procedure to successive images After 241 iterations the original picture reappears unchanged Apparently the pixels of the Poincare portrait were moving about in accordance with a strictly deterministic rule More importantly the set of all pixels the whole portrait was transformed by the distortion mechanism In this example the transformation seems to have been a reversible one since the original was faithfully recreated It is not very farfetched to introduce a certain amount of randomness and irreversibility in the above example Think of a random miscoloring of some pixels or of inadvertently giving a pixel the color of its neighbor The methods in this book are geared towards being applicable to the asymptotics of such transformation processes The transformations form a semigroup in a natural way we want to investigate the long term behavior of random elements of this semigroup *Economic Dynamics in Discrete Time, second edition* Jianjun

Miao,2020-03-03 A unified and comprehensive introduction to the analytical and numerical tools for solving dynamic economic problems substantially revised for the second edition This book offers a unified comprehensive and up to date treatment of analytical and numerical tools for solving dynamic economic problems The focus is on introducing recursive methods an important part of every economist's set of tools and readers will learn to apply recursive methods to a variety of dynamic economic problems The book is notable for its combination of theoretical foundations and numerical methods Each topic is first described in theoretical terms with explicit definitions and rigorous proofs numerical methods and computer codes to implement these methods follow Drawing on the latest research the book covers such cutting edge topics as asset price bubbles recursive utility robust control policy analysis in dynamic New Keynesian models with the zero lower bound on interest rates and Bayesian estimation of dynamic stochastic general equilibrium DSGE models This second edition has been substantially updated Responding to renewed interest in modeling with multiple equilibria it incorporates new material on this topic throughout It offers an entirely new chapter on deterministic nonlinear systems and provides new material on such topics as linear planar systems chaos bifurcations indeterminacy and sunspot solutions pruning nonlinear solutions the bandit problem rational inattention models bequests self fulfilling prophecies the cyclical behavior of unemployment and vacancies and the long run risk model The exposition of each chapter has been revised and improved and many new figures Matlab codes and exercises have been added A student solutions manual can be purchased separately *Foundations of*

Interpolation Theory, Systems Theory and Related Topics Daniel Alpay, Israel Gohberg, Victor Vinnikov, 2002-07-01. This volume is based on the proceedings of the Toeplitz Lectures 1999 and of the Workshop in Operator Theory held in March 1999 at Tel Aviv University and at the Weizmann Institute of Science. The workshop was held on the occasion of the 60th birthday of Harry Dym and the Toeplitz lecturers were Harry Dym and Jim Rovnyak. The papers in the volume reflect Harry's influence on the field of operator theory and its applications through his insights, his writings and his personality. The volume begins with an autobiographical sketch followed by the list of publications of Harry Dym and the paper of Israel Gohberg, On Joint Work with Harry Dym. The following paper by Jim Rovnyak, Methods of Kreĭn Space Operator Theory is based on his Toeplitz lectures. It gives a survey of old and recent methods of Kreĭn space operator theory along with examples from function theory especially substitution operators on indefinite Dirichlet spaces and their relation to coefficient problems for univalent functions, an idea pioneered by I. de Branges and underlying his proof of the Bieberbach conjecture (see [9]). The remaining papers arranged in the alphabetical order can be divided into the following categories: Schur analysis and interpolation. In Notes on Interpolation in the Generalized Schur Class I. D. Alpay, T. Constantinescu, A. Dijksma and J. Rovnyak use realization theory for operator colligations in Pontryagin spaces to study interpolation and factorization problems in generalized Schur classes.
