KEY CONCEPT Enzymes are catalysts for chemical reactions in living things.

MAIN IDEAS

- A catalyst lowers activation energy.
- Enzymes allow chemical reactions to occur under tightly controlled conditions.

TEKS 9C Identify and investigate the role of enzymes.

Connect to Your World

How can a Venus flytrap digest a frog? It happens through the action of proteins called enzymes. Enzymes help to start and run chemical reactions in living things. For example, enzymes are needed to break down food into smaller molecules that cells can use. Without enzymes, a Venus flytrap couldn't break down its food, and neither could you.

MAIN IDEA

A catalyst lowers activation energy.

Remember what you learned about activation energy in Section 4. Activation energy for a chemical reaction is like the energy that is needed to push a rock up a hill. When enough energy is added to get the rock to the top of a hill, the rock can roll down the other side by itself. Activation energy gives a similar push to a chemical reaction. Once a chemical reaction starts, it can continue by itself, and it will go at a certain rate.

Often, the activation energy for a chemical reaction comes from an increase in temperature. But even after a chemical reaction starts, it may happen very slowly. The reactants may not interact enough, or they may not be at a high enough concentration, to quickly form the products of the reaction. However, both the activation energy and rate of a chemical reaction can be changed by a chemical catalyst, as shown in **FIGURE 5.1**. A **catalyst** (KAT-i-hst) is a substance that decreases the activation energy needed to start a chemical reaction and, as a result, also increases the rate of the chemical reaction.

FIGURE 5.1 CATALYSTS AND ACTIVATION ENERGY

Under normal conditions, a certain amount of activation energy is needed to start a chemical reaction. A catalyst decreases the activation energy needed.

Enzyme Catalysis And Regulation Student Edition:

Enzyme Catalysis and Regulation Gorden Hammes, 2012-12-02 Enzyme Catalysis and Regulation is an introduction to enzyme catalysis and regulation and covers topics ranging from protein structure and dynamics to steady state enzyme kinetics multienzyme complexes and membrane bound enzymes Case studies of selected enzyme mechanisms are also presented This book consists of 11 chapters and begins with a brief overview of enzyme structure followed by a discussion on methods of probing enzyme structure such as X ray crystallography and optical spectroscopy Kinetic methods are then described with emphasis on the general principles of steady state and transient kinetics The chemical principles involved in enzyme catalysis are also discussed and case studies of a few well documented enzymes are presented The regulation of enzyme activity is analyzed from a nongenetic viewpoint with particular reference to binding isotherms and models for allosterism Two particular enzymes aspartate transcarbamoylase and phosphofructokinase are used as examples of well studied regulatory enzymes The last two chapters focus on multienzyme complexes and membrane bound enzymes This monograph is intended for graduate students advanced undergraduates and research workers in molecular biology and biochemistry
