

Diagnosis and management of the epilepsies in children

CHRISTINE PRAGER AND J HELEN CROSS

There are many different types of epilepsy that can occur in childhood, therefore identification and management can be complex. Here, the authors discuss the diagnosis of epilepsy in children, choice of antiepileptic drug treatments and their adverse effects, and non-pharmacological treatment options.

Epilepsy is a condition in which an individual is prone to recurrent seizures. An epileptic seizure is a change in movement or behaviour that is the direct result of a primary change in the electrical activity of the brain. Epilepsy is as common as diabetes, but continues to retain a stigma, which means many individuals with the condition remain 'hidden'. Furthermore, there is no single diagnostic test, meaning there is a high rate of misdiagnosis. Correct diagnosis and management has major implications for long-term outlook. Consequently, guidelines specify that diagnosis in children should be made by a paediatrician with expertise in the condition, based on the description of events experienced, and review should continue in secondary care.

Practical clinical definition of epilepsy

Epilepsy is a family of disorders that is comprised of many different diseases and conditions. More accurately, it should therefore be referred to as the epilepsies. In the current practical approach of the International League Against Epilepsy (ILAE), epilepsy is defined by any of the following conditions:¹

- At least two unprovoked (or reflex) seizures occurring >24 hours apart.
- One unprovoked (or reflex) seizure and a probability of further seizures similar to the general recurrence risk (at least 60%) after two unprovoked seizures, occurring over the next 10 years.
- Diagnosis of an epilepsy syndrome.

The term 'unprovoked' implies the absence of a temporary or reversible factor lowering the seizure threshold. A seizure after concussion, with fever, with alcohol withdrawal or in association with hypoglycaemia in the newborn would exemplify a provoked seizure that would not lead to a diagnosis of epilepsy.

A provocative factor is 'a transient and sporadic endogenous or exogenous element capable of augmenting seizure inci-

Jambaqué, Maryse Lassonde, Olivier Dulac, 2006-04-11 This book is devoted to the neuropsychological description of childhood epilepsy a neurological condition that constitutes one of the most prevalent forms of chronic and disabling childhood illnesses Indeed one child out of 20 experiences one or more seizures before the age of 5 and one in a hundred develops epilepsy as a chronic disorder Approximately half of these children with epilepsy display academic difficulties and or behavioral disorders Moreover it is now believed that a sizable proportion of children with learning disability suffer from undiagnosed epilepsy While a great number of textbooks have been devoted to various medical aspects of childhood epilepsy diagnosis genetics etiology drug and surgical treatment etc there have been no comprehensive accounts of the cognitive consequences of this condition Advance of medical knowledge has shown that childhood epilepsy should not be considered as a single disorder but encompasses a whole range of different conditions that exhibit specific clinical EEG and outcome characteristics It is not becoming apparent that these various clinical entities have different cognitive expression that yet need to be specified The purpose of this book is to provide a complete up to date analysis of this multi faceted pathology **Pediatric Epilepsy**
