maritime landscapes volcanic islands coastal environment granitic terrains karst etc The third and final section illustrates the ecological relationship between the environment and people volcanic hazards urban environment coastal zone development coral reefs and others The physical environment of Southeast Asia is examined at different levels covering a world region that ranges from ancient stable landmasses to dynamic unstable plate boundaries from aged primary rainforests to brash vibrant resource demanding built environments Southeast Asia has been perceived as a laboratory for studying plate tectonics It is an assemblage of large river basins peninsulas and archipelagos and seas surrounded by islands It is an area of great physical variations where parts of the physical environment have been significantly degraded anthropogenically following rapid population growth and development In large parts of the region the forms and processes on land and offshore should no longer be seen as entirely natural As this book repeatedly illustrates plate tectonics and people are both important contributors to the physical geography of Southeast Asia The contributors to this volume are distinguished scholars and have a long association with Southeast Asia The chapters are not only skilfully built on state of the art research findings but also include new material from the on going research activities of the authors The book goes beyond being the first comprehensive and detailed volume of the biophysical geography of Southeast Asia in that it also deals with the tropical environment and the relationship between environment and people in a rapidly developing world region

**Biogeography, Time and Place: Distributions, Barriers and Islands** Willem Renema, 2007-09-07 Biogeography considers the distribution of biological units over a wide range of scales The units range from genotypes populations and species to families and higher taxa Processes can be local such as the isolation on islands due to sea level fluctuations or large scale tectonic processes that separates continents and creates oceans In all processes time is an important factor and by combining data on recent patterns with paleontological data the understanding of the distribution of extant taxa can be improved This volume focuses on speciation due to isolation in island like settings and the evolution of large scale diversity as the result of origination maintenance and extinction

*The SE Asian Gateway* Robert Hall, Michael Andrew Cottam, Moyra Elizabeth Jane Wilson, 2011 Collision between Australia and SE Asia began in the Early Miocene and reduced the former wide ocean between them to a complex passage which connects the Pacific and Indian Oceans Today the Indonesian Throughflow passes through this gateway and plays an important role in global thermohaline flow The surrounding region contains the maximum global diversity for many marine and terrestrial organisms Reconstruction of this geologically complex region is essential for understanding its role in oceanic and atmospheric circulation climate impacts and the origin of its biodiversity The papers in this volume discuss the Palaeozoic to Cenozoic geological background to Australia and SE Asia collision They provide the background for accounts of the modern Indonesian Throughflow and oceanographic changes since the Neogene and consider aspects of the region's climate history
