The economic value of seasonal forecasts stochastic economywide analysis for East Africa Rodrigues, Joao,Thurlow, James,Landman, Willem,Ringler, Claudia,Robertson, Richard D.,Zhu, Tingju,2016-08-05 There is growing interest within the climate change and development

community in using seasonal forecast information to reduce the losses to agriculture resulting from climate variability especially within food insecure countries. However, forecast systems are expensive to establish and maintain and therefore gauging the potential economic return to investments in forecast systems is crucial. Most studies that evaluate seasonal forecasts focus on developed countries and/or overlook agriculture's economywide linkages. Yet forecasts may be more valuable in developing regions such as East Africa where climate is variable and agriculture has macroeconomic importance. We use computable general equilibrium and process-based crop models to estimate the potential economywide value of national seasonal forecast systems in Kenya, Malawi, Mozambique, Tanzania, and Zambia. Stochastic seasonal simulations produce value distributions for forecasts of varying accuracy and varying levels of farm coverage. A timely and accurate forecast adopted by all farmers generates average regional income gains of US \$113 million per year. Gains are much higher during extreme climate events and are generally pro-poor. The forecast value falls when forecast skill and farm coverage decline. National economic and trading structures, including the importance of agricultural exports, are found to be major determinants of forecast value. Economywide approaches are therefore needed to complement farm-level analysis when evaluating forecast systems in low-income agrarian economies.

Coping with Climate Variability Karen O'Brien, Colleen Vogel, 2017-11-22. This title was first published in 2003. Recent food shortages in Southern Africa, induced by rainfall variability but compounded by problems of governance and rising food prices, have resulted in massive relief efforts. A recent scientific innovation, supplying farmers with seasonal climate forecasts, has been touted as a way to increase preparedness for such situations. This book examines how climate forecasts are used by the agricultural community in Southern Africa. Based on a workshop funded by the World Bank, it covers a broad set of issues related to the use of seasonal forecasts, including factors that constrain users' capacities to respond. Case studies presented in the book explore how forecasts can potentially increase production and food security among a population highly dependent on agriculture and vulnerable to climate variability. The book reflects on how the production, delivery, and uptake of seasonal forecasts might be improved, as well as the limitations to their usefulness, and it should catalyze future thinking and research in this field.
