

Electrostatic Lens Systems

- Electrostatic lenses control and focus charged particles using electric fields
- They function like optical lenses but for charged particles
- Two main types are cylindrical, for simpler applications, and spherical, which correct aberrations
- They're crucial in electron microscopy, particle accelerators, and spectroscopy
- Advances continue despite challenges in precision and aberrations

Electrostatic Lens Systems:

Electrostatic Lens Systems, 2nd edition D.W.O. Heddle, 2000-12-13 *Electrostatic Lens Systems* Second Edition enables readers to design lens systems for focusing beams of charged particles that have useful characteristics. The book covers the basic theory of the motion of charged particles in electrostatic fields and describes several methods for the calculation of the potential and field distribution for various electrode geometries. It emphasizes the Bessel function expansion method developed by the author and his students and the nine point implementation of the finite difference method. Demonstration programs of other methods can be found via the websites provided. A chapter on aberrations presents formulae that enable the coefficients to be determined by an extension to the ray tracing procedures demonstrating optimum conditions for lens operation. The book is accompanied by a disk that provides a suite of computer programs LENSYS for MS DOS intended for practical use in the design and analysis of systems using round lenses with apertures or cylindrical elements. These programs are of value even to experienced workers in the field who may be quite familiar with much of the material in the text.

Electrostatic Lens Systems, D.W.O. Heddle, 1991-06 The use of electrostatic lenses for the control of ion and electron beams has grown considerably in recent years. In addition innovations in the production of low energy positrons have opened a whole new field of research for which electrostatic lenses are required. *Electrostatic Lens Systems* is therefore a timely treatise on the practical aspects of lens system design. The text gives a clear and concise treatment of the motion of charged particles in electrostatic fields and describes several methods of calculating the potential and field distributions for various electrode geometries. *Electrostatic Lens Systems* is also intended to be an interactive tutor on the practical design and analysis of systems using round lenses both apertures and cylinders through a unique suite of programs provided on IBM compatible disc. Combined with an emphasis on the Bessel function expansion method and a thorough description of the well known relaxation methods this volume will be a significant reference work and learning tool for experienced workers and new researchers alike. If you need to use electrostatic lenses then you need to read *Electrostatic Lens Systems*.

Operando Research in Heterogeneous Catalysis Joost Frenken,Irene Groot,2016-12-26 This book is devoted to the emerging field of techniques for visualizing atomic scale properties of active catalysts under actual working conditions i e high gas pressures and high temperatures It explains how to understand these observations in terms of the surface structures and dynamics and their detailed interplay with the gas phase This provides an important new link between fundamental surface physics and chemistry and applied catalysis The book explains the motivation and the necessity of operando studies and positions these with respect to the more traditional low pressure investigations on the one hand and the reality of industrial catalysis on the other The last decade has witnessed a rapid development of new experimental and theoretical tools for operando studies of heterogeneous catalysis The book has a strong emphasis on the new techniques and illustrates how the challenges introduced by the harsh operando conditions are faced for each of these new tools Therefore one can also read this book as a collection of recipes for the development of operando instruments At present the number of scientific results obtained under operando conditions is still limited and mostly focused on a simple test reaction the catalytic oxidation of CO This reaction thus forms a natural binding element between the chapters linking the demonstrations of new techniques and also connecting the theoretical and experimental studies Some first results on other reactions are also presented If there is one thing that can be concluded already in this early stage it is that the catalytic conditions themselves can have dramatic effects on the structure and composition of the surfaces of catalysts which in turn can greatly affect the mechanisms the activity and the selectivity of the chemical reactions that they catalyze

Atomic Physics with Positrons J.W. Humberston, E.A.G. Armour, 2012-12-06

The NATO Advanced Research Workshop on Atomic Physics with Positrons which was held at University College London during 15-18 July 1987 was the fourth meeting in a series devoted to the general theme of positron collisions in gases. Previous meetings have been held at York University Toronto 1981, Royal Holloway College Egham 1983 and Wayne State University Detroit 1985. Recent very significant improvements in positron beam currents due to the development of more efficient moderators and the use of more intense positron sources are making possible an increasingly sophisticated range of experiments in atomic collision physics. Whereas a few years ago only total scattering cross sections could be determined, measurements can now be made of various partial and differential cross sections. Intense positron beams are also being used to produce positronium beams and already as reported here preliminary investigations have been made of collisions of positronium with several target systems. These experimental developments have stimulated and been stimulated by steady if somewhat less spectacular progress in associated theoretical studies. Both aspects of the field are well represented in these Proceedings.
