**The Second Law of Economics** Reiner Kümmler, 2011-06-24 Nothing happens in the world without energy conversion and entropy production These fundamental natural laws are familiar to most of us when applied to the evolution of stars biological processes or the working of an internal combustion engine but what about industrial economies and wealth production or their constant companion pollution Does economics conform to the First and the Second Law of Thermodynamics In this important book Reiner Kümmler takes us on a fascinating tour of these laws and their influence on natural technological and social evolution Analyzing economic growth in Germany Japan and the United States in light of technological constraints on capital labor and energy Professor Kümmler upends conventional

economic wisdom by showing that the productive power of energy far outweighs its small share of costs while for labor just the opposite is true Wealth creation by energy conversion is accompanied and limited by polluting emissions that are coupled to entropy production These facts constitute the Second Law of Economics They take on unprecedented importance in a world that is facing peak oil debt driven economic turmoil and threats from pollution and climate change They complement the First Law of Economics Wealth is allocated on markets and the legal framework determines the outcome By applying the First and Second Law we understand the true origins of wealth production the issues that imperil the goal of sustainable development and the technological options that are compatible both with this goal and with natural laws The critical role of energy and entropy in the productive sectors of the economy must be realized if we are to create a road map that avoids a Dark Age of shrinking natural resources environmental degradation and increasing social tensions *Energy Economics: A Modern Introduction* Ferdinand E.
