Excerpt from *A Practice Book in Elementary Metallurgy*

Some two years ago the author of this volume was confronted with the problem of presenting intensive lecture and laboratory courses in metallurgy to cooperative students in mechanical civil and electrical engineering at the Engineering College University of Cincinnati. Drawing upon his own professional experience he concluded that for such students the subject matter should most profitably be arranged to throw light particularly upon the metallic materials of engineering construction how they are gained from mother nature how they are further refined and worked and how their chemical composition and past history influence their various physical properties and their adaptability for the duty expected of them. Some difficulty was experienced in discovering recent books of moderate price covering the field of non ferrous metals and alloys as well as iron and steel which could be used as texts. Fortunately Mr A P Mills of Cornell University brought out his excellent book on *Materials of Construction* at about that time which fitted our needs excellently. The problem of securing a laboratory manual however presented greater difficulties. The only note books then known to us were those by H M Howe of Columbia University and by Albert Sauveur and H M Boylston of Harvard University. These books altho excellent did not seem to be wholly adaptable to our needs so they were studied carefully together with some older laboratory exercises inherited from former instructors and a set of mimeographed instructions hastily prepared to carry the class thru the first course. Many weak points appeared in every experiment performed. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Yale University,1911 **Extractive Metallurgy 3** Alain Vignes,2013-03-01 Extractive metallurgy is the art and science of extracting metals from their ores and refining them The production of metals and alloys from these source materials is still

one of the most important and fundamental industries in both developed and developing economies around the world. The outputs and products are essential resources for the metallic mechanical, electromagnetic, electrical and electronics industries. Silicon is treated as a metal for these purposes. This series is devoted to the extraction of metals from ores, concentrates, enriched ores, scraps and other sources and their refining to the state of either liquid metal before casting or to solid metals. The extraction and refining operations that are required may be carried out by various metallurgical reaction processes. Extractive Metallurgy 1 deals with the fundamentals of thermodynamics and kinetics of the reaction processes. Extractive Metallurgy 2 focuses on pyrometallurgical, hydrometallurgical, halide and electro metallurgical conversion processes. Extractive Metallurgy 3 deals with the industrial processing operations, technologies and process routes. In other words, the sequence of steps or operations used to convert the ore to metal. Processes and operations are studied using the methodology of chemical reaction engineering. As the fundamentals of the art and science of Extractive Metallurgy are infrequently taught as dedicated university or engineering schools courses, this series is intended both for students in the fields of Metallurgy and Mechanical Engineering who want to acquire this knowledge and also for engineers put in charge of the operation of an industrial production unit or the development of a new process who will need the basic knowledge of the corresponding technology.
