Metals and Their Compounds in the Environment E. Merian, Thomas W. Clarkson, 1991 *Globalisation and Sustainable Development* Vladimir F. Krapivin, 2007-07-05 A characteristic of the present global ecological situation is increasing instability or put another way a crisis in the civilization system the global scale of which is expressed through a deterioration of human and animal habitats The most substantial features of global ecodynamics of the late 20th and early 21st centuries include the rapid increase in world population mainly in developing countries increase in the size of the urban population considerable growth in the number of megalopolises and increase in the scales of such dangerous diseases as HIV AIDS hepatitis tuberculosis etc With growing population size the problems of providing people with food and improving their living conditions in many regions will not only not be resolved but will become even more urgent Any possible benefit from decrease in per capita consumption as a result of increased efficiency of technologies will be outweighed by the impact of such a growth in population size Despite the predominant increase of population in developing countries their contribution to the impact on the environment will not necessarily exceed that of developed countries Key to ensuring sustainable development of the nature society system NSS is the relationship between production and consumption as mentioned at the World Summit on Sustainable Development in Johannesburg 2002 As civilization has developed so the problem of predicting the scale of expected climate change and associated change in human habitats has become more urgent

Hazardous Metals in the Environment M. Stoepler, 1992-04-13 The execution of detailed studies on the fate and levels of hazardous elements in the environment foodstuffs and in human beings has become a major task in environmental research and especially in analytical chemistry This has led to a demand to develop new methodology and optimize that already in use The book offers the reader a general introduction to the problem areas that are currently being tackled followed by chapters on sampling and sample preservation strategies and applications of the archiving of selected representative specimens for long term storage in

environmental specimen banks This is supplemented by the example of wine as a preserved frequently already historical specimen which clearly reflects technological changes over time The following chapters review sample treatment present an overview on the most frequently and successfully applied trace analytical methods for metals and metal compounds and introduce the increasingly important methods for identifying and quantifying metal species in sediments and soils speciation The chapters in the second part of the book provide data on analytical methods for determining the levels of toxicologically ecotoxicologically and ecologically important elements in environmental and biological materials including information on the separation and quantification of chemical and organometallic species The elements treated are aluminium arsenic cadmium chromium cobalt lead mercury nickel selenium and thallium The final chapter treats quality assurance and the importance of the continuous use of appropriate reference materials to avoid erroneous results
