Fate of Pesticides in the Atmosphere: Implications for Environmental Risk Assessment Harrie F.G. van Dijk, W. Addo J. van Pul, Pim de Voogt, 2013-04-17 Global pesticide use is currently estimated at approximately 2.5 billion kg per year Pimentel et al 1998 To be effective pesticides need to persist for a certain period of time However the longer their persistence the greater the potential for transport of a fraction of the amount applied away from the target area Pesticides are dispersed in the environment by water currents wind or biota Pesticides can directly contaminate ground and surface waters by leaching surface run off and drift Pesticides can also enter the atmosphere during application by evaporation and drift of small spray droplets that remain airborne Following application pesticides may volatilise from the crop or the soil Finally wind erosion can cause soil particles and dust loaded with pesticides to enter the atmosphere The extent to which pesticides enter the air compartment is dependent upon many factors the properties of the substance in question e.g. vapour pressure the amount used the method of application the formulation the weather conditions such as wind speed temperature humidity the nature of the crop and soil characteristics Measurements at application sites reveal that sometimes more than half of the amount applied is lost into the atmosphere within a few days Spencer and Clith 1990 Taylor and Spencer 1990 Van den Berg et al this issue
