turbulence      *Vibration Control of Active Structures* A. Preumont, 2012-12-06 I was introduced to structural control by Raphael Haftka and Bill Hallauer during a one year stay at the Aerospace and Ocean Engineering department of Virginia Tech during the academic year 1985-1986. At that time there was a tremendous interest in large space structures in the USA mainly because of the Strategic Defense Initiative and the space station program. Most of the work was theoretical or numerical but Bill Hallauer was one of the few experimentalists trying to implement control systems which worked on actual structures. When I returned to Belgium I was appointed at the chair of Mechanical Engineering and Robotics at ULB and I decided to start some basic vibration control experiments on my own. A little later smart materials became widely available and offered completely new possibilities particularly for precision structures but also brought new difficulties due to the strong coupling in their constitutive equations which requires a complete reformulation of the classical modelling techniques such as finite elements. We started in this new field with the support of the national and regional governments, the European Space Agency and some bilateral collaborations with European aerospace companies. Our Active Structures Laboratory was inaugurated in October 1995.

**Probabilistic Methods for Structural Design** Carlos Guedes Soares, 2012-12-06 This book contains contributions from various authors on different important topics related with probabilistic methods used for the design of structures. Initially several of the papers were prepared for advanced courses on structural reliability or on probabilistic methods for structural design. These courses have been held in different countries and have been given by different groups of lecturers. They were aimed at engineers and researchers who already had some exposure to structural reliability methods and thus they presented overviews of the work in the various topics. The book includes a selection of those contributions which can be of support for future courses or for engineers and researchers that want to have an update on specific topics. It is considered a complement to the existing textbooks on structural reliability which normally ensure the coverage of the basic topics but then are not extensive enough to cover some more specialised aspects. In addition to the contributions drawn from those lectures there are several papers that have been prepared specifically for this book aiming at complementing the others in providing an overall account of the recent advances in the field. It is with sadness that in the meanwhile we have seen the disappearance of two of the contributors to the book and in fact two of the early contributors to this field.

IUTAM Symposium on Dynamics of Slender Vortices Egon Krause, K. Gersten, 2012-12-06 The decision of the General Assembly of the International Union of Theoretical and Applied Mechanics to organize a Symposium on Dynamics of Slender Vortices was greeted with great enthusiasm. The acceptance of the proposal forwarded by the Deutsches Komitee für Mechanik (DEKOMECH) signaled that there was a need for discussing the topic chosen in the frame of the IUTAM Symposia offer. Also the location of the symposium was suitably chosen. It was decided to hold the symposium at the RWTH Aachen where years ago Theodore von Karman had worked on problems related to those to be discussed now anew. It was clear from the beginning of the planning that the symposium could only be held in the von Karman Auditorium of the Rheinisch

Westfälische Technische Hochschule Aachen a building named after him The symposium was jointly organized by the editors of this volume strongly supported by the local organizing committee The invitations of the scientific committee brought together scientists actively engaged in research on the dynamics of slender vortices It was the aim of the committee to have the state of the art summarized and also to have the latest results of specific problems investigated communicated to the participants of the symposium The topics chosen were asymptotic theories numerical methods vortices in shear layers interaction of vortices vortex breakdown vortex sound and aircraft and helicopter vortices **Finite Element Model**

**Updating in Structural Dynamics** Michael Friswell, J.E. Mottershead, 2013-03-09 Finite element model updating has emerged in the 1990s as a subject of immense importance to the design construction and maintenance of mechanical systems and civil engineering structures This book the first on the subject sets out to explain the principles of model updating not only as a research text but also as a guide for the practising engineer who wants to get acquainted with or use updating techniques It covers all aspects of model preparation and data acquisition that are necessary for updating The various methods for parameter selection error localisation sensitivity and parameter estimation are described in detail and illustrated with examples The examples can be easily replicated and expanded in order to reinforce understanding The book is aimed at researchers postgraduate students and practising engineers Advances in Structural Optimization J.

Herskovits, 2012-12-06 Advances in Structural Optimization presents the techniques for a wide set of applications ranging from the problems of size and shape optimization historically the first to be studied to topology and material optimization Structural models are considered that use both discrete and finite elements Structural materials can be classical or new Emerging methods are also addressed such as automatic differentiation intelligent structures optimization integration of structural optimization in concurrent engineering environments and multidisciplinary optimization For researchers and designers in industries such as aerospace automotive mechanical civil nuclear naval and offshore A reference book for advanced undergraduate or graduate courses on structural optimization and optimum design Convection in Rotating Fluids B.M. Boubnov, Georgi S. Golitsyn, 2012-12-06 Spatial inhomogeneity of heating of fluids in the gravity field is the cause of all motions in nature in the atmosphere and the oceans on Earth in astrophysical and planetary objects All natural objects rotate and convective motions in rotating fluids are of interest in many geophysical and astrophysical phenomena In many industrial applications too crystal growth semiconductor manufacturing heating and rotation are the main mechanisms defining the structure and quality of the material Depending on the geometry of the systems and the mutual orientation of temperature and gravity field a variety of phenomena will arise in rotating fluids such as regular and oscillating waves intensive solitary vortices and regular vortex grids interacting vortices and turbulent mixing In this book the authors elucidate the physical essence of these phenomena determining and classifying flow regimes in the space of similarity numbers The theoretical and computational results are presented only when the results help to explain basic qualitative

motion characteristics The book will be of interest to researchers and graduate students in fluid mechanics meteorology oceanography and astrophysics crystallography heat and mass transfer      **Solution of Crack Problems** D.A. Hills,P.A. Kelly,D.N. Dai,A.M. Korsunsky,2013-04-17 This book is concerned with the numerical solution of crack problems The techniques to be developed are particularly appropriate when cracks are relatively short and are growing in the neighbourhood of some stress raising feature causing a relatively steep stress gradient It is therefore practicable to represent the geometry in an idealised way so that a precise solution may be obtained This contrasts with say the finite element method in which the geometry is modelled exactly but the subsequent solution is approximate and computationally more taxing The family of techniques presented in this book based loosely on the pioneering work of Eshelby in the late 1950s and developed by Erdogan Keer Mura and many others cited in the text present an attractive alternative The basic idea is to use the superposition of the stress field present in the unflawed body together with an unknown distribution of strain nuclei in this book the strain nucleus employed is the dislocation chosen so that the crack faces become traction free The solution used for the stress field for the nucleus is chosen so that other boundary conditions are satisfied The technique is therefore efficient and may be used to model the evolution of a developing crack in two or three dimensions Solution techniques are described in some detail and the book should be readily accessible to most engineers whilst preserving the rigour demanded by the researcher who wishes to develop the method itself      *IUTAM Symposium on Combustion in Supersonic Flows* M. Champion,B. Deshaies,2012-12-06 Proceedings of the IUTAM Symposium held in Poitiers France 2 6 October 1995      *IUTAM Symposium on Transformation Problems in Composite and Active Materials* Yehia A. Bahei-El-Din,George J. Dvorak,2006-04-11 The field of composite materials has seen substantial development in the past decade New composite systems are being continually developed for various applications Among such systems are metal intermetallic and superalloy matrix composites carbon carbon composites as well as polymer matrix composites At the same time a new discipline has emerged of active or smart materials which are often constructed as composite or heterogeneous media and structures One unifying theme in these diverse systems is the influence that uncoupled and coupled eigenfields or transformation fields exert on the various types of overall response as well as on the respective phase responses Problems of this kind are currently considered by different groups which may not always appreciate the similarities of the problems involved The purpose of the IUTAM Symposium on Transformation Problems in Composite and Active Materials held in Cairo Egypt from March 10 to 12 1997 was to bring together representatives of the different groups so that they may interact and explore common aspects of these seemingly different problem areas New directions in micromechanics research in both composite and active materials were also explored in the symposium Specifically invited lectures in the areas of inelastic behavior of composite materials shape memory effects functionally graded materials transformation problems in composite structures and adaptive structures were delivered and discussed during the three day meeting This book contains the printed

contributions to the IUTAM Symposium

**Advances in Turbulence VI** S. Gavrilakis, L. Machiels, P.A.

Monkewitz, 2012-12-06 Advances in Turbulence VI presents an update on the state of turbulence research with some bias towards research in Europe since it represents an almost complete collection of the paper presentations at the Sixth European Turbulence Conference sponsored by EUROMECH ERCOFTAC and COST and held at the Swiss Federal Institute of Technology in Lausanne July 2-5 1996. The problem of transition together with the structural description of turbulence and the scaling laws of fully developed turbulence have continued to receive most attention by the research community and much progress has been made since the last European Turbulence Conference in 1994. The volume is thus geared towards specialists in the area of flow turbulence who could not attend the conference as well as anybody who wishes quickly to assess the most active current research areas and the groups associated with them.
