Micro-econometrics for Policy, Program, and Treatment Effects Myoung-jae Lee,2005 In many disciplines of science it is vital to know the effect of a treatment on a response variable of interest the effect being known as the treatment effect Here the treatment can be a drug an education program or an economic policy and the response variable can be an illness academic achievement or GDP Once the effect is found it is possible to intervene to adjust the treatment and attain a desired level of the response variable A basic way to measure the treatment effect is to compare two groups one of which received the treatment and the other did not If the two groups are homogenous in all aspects other than their treatment status then the difference between their response outcomes is the desired treatment effect But if they differ in some aspects in addition to the treatment status the difference in the response outcomes may be due to the combined influence of more than one factor In non experimental data where the treatment is not randomly assigned but self selected the subjects tend to differ in observed or unobserved characteristics It is therefore imperative that the comparison be carried out with subjects similar in their characteristics This book explains how this problem can be overcome so the attributable effect of the treatment can be found This book brings to the fore recent advances in econometrics for treatment effects The purpose of this book is to put together various economic treatments effect models in a coherent fashion make it clear which can be parameters of interest and show how they can be identified and estimated under weak assumptions The emphasis throughout the book is on semi and non parametric estimation methods but traditional parametric approaches are also discussed This

book is ideally suited to researchers and graduate students with a basic knowledge of econometrics

Equity and Excellence in American Higher Education William G. Bowen, Martin A. Kurzweil, Eugene M. Tobin, Susanne C. Pichler, 200? Thomas Jefferson once stated that the foremost goal of American education must be to nurture the natural aristocracy of talent and virtue Although in many ways American higher education has fulfilled Jefferson's vision by achieving a widespread level of excellence it has not achieved the objective of equity implicit in Jefferson's statement In *Equity and Excellence in American Higher Education* William G Bowen Martin A Kurzweil and Eugene M Tobin explore the cause for this divide Employing historical research examination of the most recent social science and public policy scholarship international comparisons and detailed empirical analysis of rich new data the authors study the intersection between excellence and equity objectives Beginning with a time line tracing efforts to achieve equity and excellence in higher education from the American Revolution to the early Cold War years this narrative reveals the halting episodic progress in broadening access across the dividing lines of gender race religion ethnicity and socioeconomic status The authors argue that despite our rhetoric of inclusiveness a significant number of youth from poor families do not share equal access to America's elite colleges and universities While America has achieved the highest level of educational attainment of any country it runs the risk of losing this position unless it can markedly improve the precollegiate preparation of students from racial minorities and lower income families After identifying the equity problem at the national level and studying nineteen selective colleges and universities the authors propose a set of potential actions to be taken at federal state local and institutional levels With recommendations ranging from reform of the admissions process to restructuring of federal financial aid and state support of public universities to addressing the various precollegiate obstacles that disadvantaged students face at home and in school the authors urge all selective colleges and universities to continue race sensitive admissions policies while urging the most selective and privileged institutions to enroll more well qualified students from families with low socioeconomic status

Modeling the Effects of Financial Aid on Student Enrollment Decisions Linda Siefert, 2021 Over the last two decades many institutions of higher education have experienced admissions related problems due to fluctuations in student enrollment and the increasing need for institutional financial aid Because of this administrators need tools that can help them modify policy as the market changes The purpose of this research was to develop a tool for a private more selective institution that would answer the following questions 1 what is the probability of enrollment for each admitted student and 2 how would changes in the financial aid package affect this probability The model in this research was based on both economic theory and the results of other empirical work and was refined through statistical analysis Its goal was to develop the best predictive model using the data collected by the institution and available to it at the time admission and

financial aid decisions are made. The methodology was carried out in three steps. First, an enrollment probability model was estimated using three years (1998-2000) of admissions data from the institution using both logistic and probit regression. The model included a unique set of explanatory variables including religious affiliation and distance from home, showing the ease at which institutions can look at the variables that are important for their goals, policies, and practices. The second step was a temporal validation against additional data. The model was tested for predictive accuracy against the admissions data for 2001. After rerunning the model for all four years, the final step in the methodology was to simulate the effects on enrollment of various changes in the tuition and financial aid policy and to calculate price sensitivity. The results of this study for the most part confirmed economic theory and general empirical findings. The signs and significance of most coefficients were as expected. A unique finding was that a linear, constantly decreasing functional form for net price was not the best fit for the data. Rather, a cubic relationship between net price and enrollment probability provided a better fit. Classification accuracy within each model and predictive accuracy for 2001 were all near 70%. Sensitivity to price was calculated differently in this research than in other existing research. Due to mathematical shortcomings discussed in the study, ΔP s and student price response coefficients (SPRC) were not used. Rather, sensitivity to a 1,000 decrease in net price was calculated for each student. The mean sensitivity to a 1,000 decrease in net price was 0.2. That is, on average, a 1,000 decrease in net price increased the probability of enrollment by 2%, for example, from 20% to 22%. The results of the present study are lower than most existing research, which is consistent with the discussions in the field that statistics such as ΔP s and SPRCs calculated only at the mean can overestimate sensitivity. The implication for policy makers is that they need to look at specific students or groups of similar students when estimating the effect of policy decisions and not rely solely on an average estimate. This research not only provided such price sensitivities for students with various characteristics of interest to the institution but also provided the institution with a tool to use with each entering class of freshman.
