Galactic And Intergalactic Magnetic Fields:

Galactic and Intergalactic Magnetic Fields Ulrich Klein, Andrew Fletcher, 2014-11-05 This course tested textbook conveys the fundamentals of magnetic fields and relativistic plasma in diffuse cosmic media with a primary focus on phenomena that have been observed at different wavelengths Theoretical concepts are addressed wherever necessary with derivations presented in sufficient detail to be generally accessible In the first few chapters the authors present an introduction to various astrophysical phenomena related to cosmic magnetism with scales ranging from molecular clouds in star forming regions and supernova remnants in the Milky Way to clusters of galaxies Later chapters address the role of magnetic fields in the evolution of the interstellar medium galaxies and galaxy clusters The book is intended for advanced undergraduate and postgraduate students in astronomy and physics and will serve as an entry point for those starting their first research projects in the field

Magnetic Fields of Galaxies A.A.

Ruzmaikin, D.D. Sokoloff, A.M. Shukurov, 2013-06-29. Magnetism when extended beyond normal frameworks into cosmic space is characterized by an enormous spatial scale. Because of their large sizes the nature of magnets such as the Earth and the Sun is entirely different from the nature of a horseshoe magnet. The source of cosmic magnetism is associated with the hydrodynamic motions of a highly conductive medium. In this aspect cosmic magnets resemble a dynamo. However currents in the dynamo flow along properly ordered wires while chaotic turbulent motions are dominant inside stars and liquid planetary cores. This makes more intriguing and surprising the fact that these motions maintain a regular magnetic field. Maintenance of magnetic fields is even more impressive in huge magnets i.e. galaxies. In fact we are living inside a giant dynamo machine the Milky Way galaxy. Although the idea of the global magnetic field of our Galaxy was clearly proposed almost 40 years ago, firm observational evidence and definite theoretical concepts of galactic magnetism have been developed only in the last decade. This book is the first attempt at a full and consistent presentation of this problem. We discuss both theoretical views

on the origin of galactic magnetism and the methods of observational study Previous discussions were on the level of review articles or separate chapters in monographs devoted to cosmic magnetic fields see e g H K Moffatt 1978 E N Parker 1979 and Zeldovich et al 1983

The Galactic Interstellar Medium W.B. Burton, B.G. Elmegreen, R. Genzel, 2006-04-18

The previous Saas Fee Advanced Course dedicated to the interstellar medium took place in 1972 The tremendous scientific advances that have occurred in this field since then in particular owing to the availability of receivers working at completely unexplored wavelength bands fully justified a new set of lectures As a consequence the members of the Swiss Society for Astrophysics and Astronomy voted that The Galactic Interstellar Medium should be the subject of the 1991 course The 21st Saas Fee Advanced Course took place in Les Diablerets from 18 to 23 March 1991 gathering together about 80 participants from all over the world but mostly from Europe According to a rule that has proved to lead to success but also to challenge the lecturers energy the format of a Saas Fee Advanced Course consists traditionally of 28 lectures of 45 minutes which take place in the morning and late afternoon leaving ample time for discussions self study hiking or skiing Despite the inordinate work load imposed this year's lecturers felt that the subject was sufficiently dense to increase the lecture time by 1/3 This proved judicious and left more time for questions and discussions during the lectures

Cosmic Magnetic Fields, On the Structure of Physical Vacuum and a New Interaction in Nature (theory, Experiment, Applications) I. U. A. Baurov, 2000

In the book an unconventional physical model of creation of the observed physical space from a finite set of special discrete objects byuons is presented The global space anisotropy associated with a cosmological vectorial potential appearing in the definition of byuons as well as a new interaction due to this anisotropy are predicted Results of an experimental investigation of the proposed new interaction are given A new method of power production based on the new interaction as well as a new principle of motion of objects in nature with the use of physical space as a support medium are advanced The book is intended for the general reading public physicists theorists and experimenters astrophysicists engineers specialists in space technology and power engineering and physical students

Redefining Standard Model Cosmology Brian Albert

Robson, 2019-06-12 The current standard model of cosmology is based primarily on two incompatible theoretical models 1 the standard model of particle physics which describes the physics of the very small in terms of quantum mechanics and 2 the general theory of relativity which describes the physics of the very large in terms of classical physics Both these theoretical models are considered to be incomplete in the sense that they do not provide any understanding of several empirical observations such as the Big Bang dark matter dark energy gravity and matter antimatter asymmetry in the universe The main aim of this book is to discuss these serious problems that threaten to undermine the current standard model of cosmology

Physics and Astrophysics of Ultra High Energy Cosmic Rays M. Lemoine, G. Sigl, 2008-01-11 The International School on Physics and Astrophysics of Ultra High Energy Cosmic Rays UHECR2000 was held at the Observatoire de Paris Meudon on June 26-29 2000 This was the first international school specifically dedicated to ultra high energy cosmic rays Its aim was to familiarize with and attract students physicists and astronomers into this quickly developing new research field The mysterious and currently unknown origin of the most energetic particles observed in Nature has triggered in recent years theoretical speculations ranging from electromagnetic acceleration to as yet undiscovered physics beyond the Standard Model It has also led to the development of several new detection concepts and experimental projects some of which are currently under construction By its nature the field of ultra high energy cosmic rays is therefore highly interdisciplinary and borrows from astrophysics and cosmology via particle physics to experimental physics and observational astronomy One main aspect of the school was to emphasize and take advantage of this interdisciplinarity The lectures were grouped into subtopics and are reproduced in this volume in the following order After a general introductory lecture on cosmic rays follow two contributions on experimental detection techniques followed by three lectures on acceleration in astrophysical objects The next four contributions cover all major aspects of propagation and interactions of ultra high energy radiation including speculative issues such as new interactions

Plasma Instabilities of TeV Pair Beams Induced by Blazars Mahmoud S. A. Alawashra, 2025-09-26 This thesis develops a new theory combining the beam plasma instability and IGMF in one picture Recently it was observed that the expected cascade emission of gamma rays in the TeV range from some distant blazars is not seen in their spectra The underlying physical processes are well known and a failure of the model predictions would shake the foundations of modern physics unless a credible explanation for this failure is found One could argue that a femto Gauss strong magnetic field in the cosmic voids would disperse the cascade emission although the question remains as to how this magnetic field was generated Mahmoud Alawashra provides us with a carefully crafted assessment of a second possibility namely energy loss due to plasma instabilities in the cosmic voids His first point is what if there is a weak magnetic field It might not dilute the cascade emission but suppress the beam plasma instabilities ruling out an intermediate range of magnetic field amplitudes where neither scenario works Mahmoud's study is the first in the literature to combine

instability and IGMF in one picture Authors then investigated the nonlinear feedback of the instability and finds it in a quasi steady state where the energy loss of the cascades is weak The whole study is simply outstanding and combines analytical skills with numerical ability *TeV Gamma-Ray Astrophysics* Heinrich J. Völk, Felix A. Aharonian, 2012-12-06 The International Heidelberg Workshop on TeV Gamma Ray Astrophysics brought together astrophysicists from the various fields which play a role in the formation of high energy gamma ray emission In particular theoretical and observational aspects of the physics and astrophysics of pulsars and quasars the acceleration of particles at Supernova Remnants and other strong astrophysical shock fronts and cascade processes in universal background photon fields were comprehensively discussed in more than thirty reviews by leading experts In their entirety these reviews describe the birth of a new field of astronomy This field concerns cosmic gamma rays of very high energy which are observed with ground based optical telescopes due to the Cherenkov emission of the secondary particles created by the interaction of these gamma rays with atoms in the Earth's atmosphere Beyond that the workshop encompassed the latest developments and trends in theory and observation of cosmic gamma ray sources of all energies from nuclear gamma ray lines in the MeV region through the Bremsstrahlung Inverse Compton and pion decay continuum emission to gamma rays due the decay of exotic relics from the early Universe Audience Specialists as well as students in physics and astrophysics and young research workers

Astrophysical Aspects Of The Most Energetic Cosmic Rays - Proceedings Of The Icr International Symposium M Nagano, F Takahara, 1991-07-23 The proceedings present new results obtained from recent observations by the Haverah Park Yakutsk Fly's Eye and Akeno groups on the shape of the energy spectrum the arrival direction point source and the nature of the most energetic cosmic rays They also contain an in depth discussion of the present status of observations on discrete sources at TeV and PeV energies A detailed discussion of the physics problems related to the origin acceleration mechanism and propagation of the most energetic cosmic rays in the galactic and extragalactic space is given in relation to observable features
