 R.F.C. Farrow,S.S.P. Parkin,P.J. Dobson,J.H. Neave,A.S. Arrott,2013-03-09 This work represents the account of a NATO Advanced Research Workshop on Thin Film Growth Techniques for Low Dimensional Structures held at the University of Sussex Brighton England from 15 19 Sept 1986 The objective of the workshop was to review the problems of the growth and characterisation of thin semiconductor and metal layers Recent advances in deposition techniques have made it possible to design new material which is based on ultra thin layers and this is now posing challenges for scientists technologists and engineers in the assessment and utilisation of such new material Molecular beam epitaxy MBE has become well established as a method for growing thin single crystal layers of semiconductors Until recently MBE was confined to the growth of III V compounds and alloys but now it is being used for group IV semiconductors and II VI compounds Examples of such work are given in this volume MBE has one major advantage over other crystal growth techniques in that the structure of the growing layer can be continuously monitored using reflection high energy electron diffraction RHEED This technique has offered a rare bonus in that the time dependent intensity variations of RHEED can be used to determine growth rates and alloy composition rather precisely Indeed a great deal of new information about the kinetics of crystal growth from the vapour phase is beginning to emerge *Defect Control in Semiconductors* K. Sumino,2012-12-02 Defect control in semiconductors is a key technology for realizing the ultimate possibilities of modern electronics The basis of such control lies in an integrated knowledge of a variety of defect properties From this viewpoint the volume discusses defect related problems in connection with defect control in semiconducting materials such as silicon III V II VI compounds organic semiconductors heterostructure etc The conference brought together scientists in the field of fundamental research and engineers involved in application related to electronic devices in order to promote future research activity in both fields and establish a fundamental knowledge of defect control The main emphasis of the 254 papers presented in this volume is on the control of the concentration distribution structural and electronic states of any types of defects including impurities as well as control of the electrical optical and other activities of defects Due to the extensive length of the contents only the number of papers
