**From precocious puberty to infertility: metabolic control of the reproductive function** Meenakshi Alreja, Carol F. Elias, Jennifer W. Hill, 2013-06-03 The existence of a fundamental link between nutrition and reproduction is well established It is known for decades that a critical amount of stored energy is required for sexual maturation and maintenance of fertility This concept is based on the idea that when survival is threatened by scarcity of food or increased energy demands male and female of most species divert energy away from reproduction This includes sexual maturation the production of reproductive hormones and gametes and the maintenance of pregnancy and lactation If excessive leanness occurs in young women puberty is often delayed On the other hand excess stored energy also negatively impacts fertility Elevated adiposity aggravates polycystic ovarian syndrome ovulatory dysfunctions and may induce hypothalamic hypogonadism in women In obese men fertility is usually decreased likely due to altered activity of the hypothalamus pituitary axis and defective steroidogenesis in testis Recently studies have documented the link between the advance of obesity and the increasing rates of precocious puberty In 1997 an epidemiologic study reported that 6 7% of American girls had clinical evidence of puberty at age 7 years and 14 7% at age 8 years That study described the youngest ever reported population age at puberty onset of 9 96 1 82 years In September of 2010 an alarming study showed that this phenomenon has been aggravated in the last decade The authors found an increment of 5 8% in the number of girls with clinical evidence of puberty at age 7 and 8 years compared to the 1997 study They also reported a high correlation of early puberty onset and childhood obesity These observations suggest the existence of a previously unrecognized deleterious effect of the increasing rates of childhood obesity the precocious puberty which will bring profound social and health implications for the next generations Earlier menarche in girls is associated with increased risk of adult obesity type 2 Diabetes and breast cancer Thus changing levels of key metabolic cues is an essential signal for the onset of puberty and maintenance of the tone of the reproductive system As the activity of gonadotropin releasing hormone GnRH neurons is essential for the development and maturity of the reproductive axis efforts have been made to identify the factors that directly regulate the activity of GnRH neurons For example sensory signals and metabolic cues e g glucose may reach the reproductive control sites of the central nervous system via sensory inputs conveyed by the vagus nerve or by direct action in the caudal brainstem In addition circulating metabolic factors such as leptin insulin and ghrelin also inform the brain about the individual nutritional state The goal of this Research Topic is to assemble multidisciplinary specialists to provide up to date reviews on the recent advances and achievements in the field      *Research Awards Index* ,1977      **Index Medicus** ,2001-06 Vols for 1963 include as pt 2 of the

**Reproductive Endocrinology** P. Jorge Chedrese, 2009-06-13

Molecular biology emerged from advances in biochemistry during the 1940s and 1950s when the structure of the nucleic acids and proteins were elucidated Beginning in the 1970s with nucleic acid enzymology and the discovery of the restriction enzymes the tools of molecular biology became widely available and applied in cell biology to study how genes are regulated This new knowledge impacted endocrinology and reproductive biology since it was largely known that the secretion of the internal glands affected the phenotypes and expression of genes Modern reproductive biology encompasses every level of biological study from genomics to ecology encompassing cell biology biochemistry endocrinology and general physiology All of these disciplines require a basic knowledge both as a tool and as an essential aid to a fundamental understanding of the principles of life in health and disease Overall molecular biology is central to scientific studies in all living matter impacting disciplines such as medicine related health sciences veterinary agriculture and environmental sciences In this book the basic biochemistry of nucleic acids and proteins are reviewed Methodologies used to study signaling and gene regulation in the endocrine reproductive system are also discussed Topics include mechanisms of hormone action and several endocrine disorders affecting the reproductive system Professionals in the medical veterinary and animal sciences fields will find exciting and stimulating material enhancing the breadth and quality of their research
